
A PRACTICAL TEXTBOOK

Video Production

Thirteen chapters from planning to delivery, for the classroom and the set

Jia Ahn

VIDEO PRODUCTION · A PRACTICAL TEXTBOOK

Video Production

A practical textbook in 13 chapters, from planning to delivery

Jia Ahn

Contents

— Front matter

8 Colophon
9 Preface — why this book, why now
10 Author's note — on making a model for teaching
11 How to read this book
12 How to use this book
13 Learning roadmap
14 30 questions to ask first

00 Prologue — The basic units of the screen 16

16 Frame and aspect ratio
18 Resolution · frame rate · shutter
19 Cut · scene · sequence · take
21 Horizontal, vertical and platform specs

01 The language of video 23

24 Introduction
24 How film grammar was made
26 Shot, scene, sequence: the units of video
27 8 shot types by distance
32 Shots by number of people
33 Shots by situation
36 Angle: the power of camera height
40 How does the eye read the screen?
41 Composition: placement within the frame
46 Guiding the eye and reading the frame
47 The 180° rule and the 30° rule
51 Camera movement and emotion
54 Types of cuts and transitions
57 Mise-en-scène and montage
58 Color and production design
60 Shot breakdown drill: taking 30 seconds apart
62 The meaning color makes
64 Point of view
65 Cropping
66 Angles on the face
68 Eyeline direction: meeting and following
72 Principles of visual form
74 Time and space in video
76 Exercises and review

02 Planning and pre-production 79

80 Introduction
80 Feature · The storyboard
82 Anatomy of a panel
83 Panel templates by aspect ratio
84 Horizontal and vertical are not different media but different languages
86 360 · VR boards
87 Curved LED · dome · media facade
88 AR · MR · XR boards
89 Camera language drawn inside the panel
90 Making narration and sound 'visible'
91 Drawing for legibility
92 All notation symbols
94 Feature · PPM
96 Tone and manner board
97 Location reference sheet
98 Actor sheet
99 Wardrobe board and mise-en-scène map
100 Shooting schedule
102 Shooting timetable and call sheet

103 Budget line items and PPM meeting rules
106 Archetypes of story
107 A map of the whole production pipeline
108 Reading the brief and planning intent
110 Generating ideas: the 6 Thinking Hats
112 Concept types and testing
113 Synopsis, treatment, screenplay
114 Writing a proposal
117 Team roles and collaboration
119 Entering contests and writing proposals
120 Planning and shooting interview videos
122 Seven concepts that drive film
125 Design thinking and the language of feeling
126 Design thinking that builds a world from adjective keywords
128 Exercises and review

03 Camera gear and technique 131

132 Introduction
132 Lens and eye — machine vision and human vision
134 A lineage of camera gear
134 Camera types and how to choose
135 Sensor size and angle of view
137 The psychology of lenses and focal length
140 The exposure triangle
144 Units of illuminance and light
145 Resolution standards and aspect ratio
147 Frame rate and shutter angle
149 Color temperature and white balance
152 Codecs · bit depth · log
155 Camera support and movement
159 Mirrorless setup in practice
162 Shooting with a smartphone
163 Filters and drone shooting
167 Exercises and review

04 Lighting and sound 171

172 Introduction
172 An aesthetic history of light
174 Five properties of light
175 Three-point lighting and its variations
178 Key light in brief
180 High key and low key
182 Lighting for product ads
185 Chroma key lighting in practice
189 Low-budget lighting substitutes
191 Feature · Tools of light
192 From pin spot to ambient
193 Tools that change light
194 Eight lighting setups
195 Light in software
197 On-set lighting cheat sheet
198 How sound changes the image
199 Microphones and recording
203 The four layers of sound design
204 Sound effects and Foley
207 Exercises and review

05 Editing and post-production 211

212 Introduction
212 Invisible editing
213 History of editing tools
214 Basic editing principles
216 Comparing editing software
217 Premiere Pro at a glance
219 After Effects at a glance
223 The illusion of life
224 The 12 principles of animation
228 Compositing and keying in practice
229 Color grading

231 Mobile and automated editing tools
232 Output specs and delivery
234 Expressions and automation
235 DaVinci Resolve features
236 Types of animation
240 Exercises and review

06 Media specs and immersive content 243

244 Introduction
244 A history of screens and the audience's body
246 Production specs by medium
247 Horizontal and vertical
248 Safe areas and platform UI
249 21:9 CinemaScope in practice
251 How immersion is made
252 Planning 360 video and VR
256 AR ads and WebAR
258 Planning MR and XR exhibitions
262 Projection mapping
264 Outdoor advertising and anamorphic illusion
268 LED signage and transparent LED
270 Viewing environments and audiences
274 Types of immersive content projects
275 New displays and spatial media
281 Dimensions of form
284 Exercises and review

07 Advertising production and case studies 287

288 Introduction
288 How ads are remembered
289 The basic structure of an ad
291 3-second hook design
294 Marketing frames and message design
295 Visual design by Korean directors
297 Composition principles of world masters
298 Reference research methods
299 The logic of copyright
300 Copyright and production ethics
302 How to read case studies
303 When technology changed form
304 Film: technology and form
306 Korean film: the director's signature
308 Animation: principles accumulated
310 OTT and drama: the power of structure
312 Social media: built to be discovered
313 Advertising: the architects of 15 seconds
314 Music videos and K-culture
317 Length sets the form
319 Ads people watch to the end
321 Making the brand stick
322 Designing outdoor LED loops

08 Platform operations and generative AI 325

326 Introduction
326 The attention economy and the algorithmic audience
328 Platform map
329 Running YouTube
331 The big 3 short-form platforms compared
333 Running Instagram
334 TikTok and remix culture
335 Threads and text-based media
336 Blog platforms compared
337 Key performance indicators
339 What generative AI changes
340 Comparing generative AI tools
343 Running a channel and the content calendar

344 Writing titles and hooks
346 Basics of running SNS ads
349 Designing an AI production pipeline
353 The corporate landscape and where the market is heading
354 Exercises and review

09 Industry and market trends 357

358 Introduction
358 Where the value of video comes from
360 The structure of the video industry
361 Trends in the Korean market
362 Overseas market trends and differences
364 Advertising · commerce · creators
365 What a price pays for
366 Freelance rates and contracts
368 Career paths by role
370 Exercises and review

10 Jobs and careers 373

374 Introduction
374 What outlasts the tools
376 A map of video jobs
377 What newcomers are actually asked for
378 Building a portfolio
381 What a portfolio proves
382 Making a showreel
383 Résumé and cover letter
385 Interview prep and practice
386 Work attitude and communication
388 First 3 months and growth paths
389 Hiring case studies
390 Freelancing and startups
391 Sample portfolio page layout
393 Online communication and remote collaboration
394 Interview question bank by role
396 Feedback cases from student work
397 Job-hunting tips
399 Beyond the tools
400 The age of the one-person company
401 Exercises and review

11 Practice and careers in the AI transition 405

406 What gets expensive when tools get cheap
407 How much production time has shrunk
409 Reshaping the pipeline
412 Where in the process it is used
414 People, digital doubles, consent
417 Sets, LED walls, generated backgrounds
419 Elements and particles
422 Traditional production and AI production
425 The changing Korean job market
429 How portfolio platforms are changing
431 Overseas markets and LinkedIn
435 Student vision and expertise
439 Key message and copy
440 The at-a-glance proposal
443 Turning your work into a job
445 One-page summary

12 What is video? 447

448 Introduction
448 What does the moving image hold on to?
450 Defining video and the principles of perception
452 Devices before cinema
453 The birth of cinema and the silent era
455 Sound, color, widescreen
457 Television and broadcast video
458 From analog video to digital
460 The age of internet video and platforms
461 The landscape of the generative AI video era
463 A brief history of the Korean screen industry
464 Working principles from history
466 Theory that changes your work on set
468 The birth and principles of photography
471 From darkroom to print
474 The devices we watched on
478 Exercises and review

13 Media art and expanded cinema 481

482 The man who turned television around
484 What is media art?
486 How video and media art differ
488 The media art landscape in Korea today
491 Tool map
494 Making it work in the gallery
496 Artwork statements and portfolios
497 Open calls and grants
500 Three debates
503 One-page summary

14 Appendix 505

506 Pre-shoot equipment checklist
506 Running the shoot day
507 Media management and backup
507 Safety and legal checklist
508 Post-production and delivery checklist
508 Glossary of video terms
510 Keyboard shortcuts
510 15-week course plan
511 Image-generation prompt guide
512 References and sources
513 Exercise worksheet forms
514 50 common mistakes
516 On-set terms
517 Korean-English term table
518 Standard production schedule templates
519 Recommended learning path and resources
520 List of plates and production prompts
521 Exercise worksheets
522 Worksheet 3 · 6-panel storyboard
523 Worksheets 4 · 5 · 6
524 Equipment by budget
525 Field document templates
526 Photo plate placement guide
526 Reviewer comments and revisions
528 Reference photo list and generation prompts
532 Explanatory plates and figure · equipment drawings
534 Exercises and review
535 List of figures
536 15 seconds is not short
537 8 storyboard templates
546 Generated reference photos and their prompts

Colophon

Title	Video Production: A Practical Textbook — 13 chapters for the classroom and the set
Author	Jia Ahn
Edition	First edition
Contents	13 chapters · 23 Background readings · 91 diagrams · 24 explanatory plates · 56 figure drawings · 29 equipment drawings · 135 reference photos · 170 section exercises
Use	University textbook, job training, practitioner's reference
Price	KRW 25,000

All diagrams in this book were designed by the author. The figure and equipment drawings, explanatory plates and reference photos were made with generative image models; the generation conditions are disclosed in Appendix S. Reference photos in the text are staged images made with generative AI, not photographs of real people or specific works. Directors and production companies are cited solely for the analysis of technique.

About the author

Jia Ahn AHN JIA

Born in Germany. BA, MA and PhD in Media Design from Ewha Womans University; completed the Global Executive Program at Seoul National University.

Current	Assistant professor, Dept. of Video Media Contents, Kyungbok University · Director, PR Design Center
Former	Image designer, PR team, Seongnam City Hall public information office
Former	CEO, Doshim Co., Ltd.

Books *What Is UX? · ChatGPT in the Classroom: code & play* Picture books *The Robot That Wakes the Brain · From Soil to AI · Dreams with Sion · Why Do We Wear Masks?*

Preface — why this book, why now

The video production environment of 2026 is richer than a decade ago by any measure. The device in your pocket shoots 4K, free editing software yields commercial results, and a few sentences conjure scenes that never existed. What the learner needs now is neither equipment nor information. It is order.

That is exactly where the problem begins. When information is scattered without limit, learners cannot tell what to learn first. They pick up color grading before aperture, and download transition effects before understanding the cut. More tools, fewer finished works — the paradox comes from here. Search gives you knowledge, but not the arrangement of knowledge.

Generative AI has widened the gap. The bar for output has dropped; the bar for judgment has risen. The old proposition that stronger tools raise the value of people who know the principles has never been confirmed so plainly.

This book is an attempt to provide that arrangement. From what video is, through language, technique and planning, to media, market and career, it lays one path a person can walk from beginning to end. Each part stands alone so you can start in the middle, and read in order they form a single narrative.

At the same time, this book is intensely practical. The chapter after explaining why shutter speed is fixed gives setting presets by camera model; the chapter after explaining what a storyboard means gives the full notation set and blank templates. Learn principle and execution apart and each is half of itself. The tables and checklists here are not for reading but for opening on set.

Finally, employment gets a part of its own. Most people who pick up this book want to make a living from video. Knowing which companies hire whom, what a portfolio must prove, and how to survive the first three months is a skill too. A textbook that does not teach it is only half honest.

Author's note — on making a model for teaching

Video production grew up as an industry before it was established as a discipline. The field has a vast body of practice, but texts that organize it into a system are rare. Shooting lives in camera manuals, editing in software guides, careers in job-hunting material, and the learner must stitch the pieces together alone. That stitching is hardest for beginners: knowing what to learn first already takes knowledge.

The teaching side is no different. In a field without a standard textbook, lectures depend on personal experience. Experience is vivid but not reproducible. Reproducibility is the minimum requirement of education, and it begins with a shared text.

This book is an attempt to make that text once. The goal is not a finished canon but a floor on which later revisions and rebuttals can stand. So the content was selected by one criterion: will it still hold in five years? Menu locations in particular software and specs of particular cameras appear only minimally; the pages go to the order of judgment instead. Tools get replaced; the order does not.

The structure assumes both the first-time learner and the person teaching them. Each part opens with a narrative introduction for context, arranges the knowledge item by item, and closes with a one-page summary for class. All plates are monochrome, so nothing is lost in black-and-white copies or on low-resolution projectors.

The same reason governs the part on generative AI, which centers on where in the pipeline to place what, rather than how to operate individual services. Tools live short lives; structures live long ones. In an environment where anyone can make a plausible picture, education's share is not the transfer of functions but the training of judgment.

A word on examples. This book reproduces no frame from any existing work. All diagrams were designed from scratch; drawings and reference images were made with generative image models, their generation conditions disclosed in the appendix. A text that teaches how to make good video should not be built on other people's results.

If this book becomes someone's first textbook, someone's syllabus, or lies open on someone's desk on set, it has done its job. Tell me where the explanation stalls and where it did not fit the field; that is where the next edition begins.

Spring 2026, Jia Ahn

How to read this book

THE READER THIS BOOK ASSUMES

You need never have touched a camera. But by the time you close this book, you should be able to take a 15-second ad, a 1-minute short-form video and a 3-minute brand film from planning to delivery on your own. The content was chosen by that standard.

This book is designed to be used, not just read. Each of the 13 chapters is one self-contained class session, and every chapter arranges the same elements in the same order: lesson plan, narrative introduction, concepts, plates, exercise missions, one-page summary. Use only the chapters you need, or go in order for a full semester.

Start

Using it in class

- Time allocation for a 50-minute session, materials, check points
- Use it as the lesson plan as is

Plates

Look at the picture first

- All plates sit directly in the text
- Most concepts are explained in a single diagram

Tables

Reference tables to copy

- Reference tables used as is in practice
- Meant to be opened on set

End

Missions · Questions to consider · Field tips

- Can be assigned as homework as is
- Also a checklist for self-study

Appendix

Worksheets and memo space

- Print the appendix worksheets and use them as is
- Question memo on a chapter's first page, review notes on its last: 5 minutes before and after class

PART

Question → Background → Items

- First page: one question and 'How this PART is organized'
- Then 'Background' (2–3 pages), theory and history in narrative form

Section

Always the same order

- Every section opens with a wine-red section number and a heavy rule
- Text and diagrams → field sentence (gray box) → reference photos (REF) → explanatory plate (G) → exercise box (Task · Tip · Assessment points · Model answer)

Images · figures

Generative drawings, figures as of writing

- People and gear in reference photos and plates are pencil drawings made with generative image models for this book (conditions: Appendix S)
- Product names, prices and platform specs change; figures are as of writing

How to use this book

One chapter is one class session. Thirteen chapters plus a midterm review and project weeks fill a 15-week semester. See Appendix H for the weekly schedule. Self-learners can take the time allocation in each chapter's class guide as their own study plan.

Format	Recommended structure	Assessment link
Theory-led lecture	Read the part's opening essay + walk through plates + table exercise	Use self-check items as quizzes
Practice-led lecture	5-minute explanation from a plate, then shoot immediately	Exercises as weekly submissions
Team project	PART 2 proposal template and PPM document as deliverables	Submit Appendix K worksheets
Flipped learning	Read the part in advance; class is critique and feedback	Peer review with the 50 mistakes in Appendix P

Plates are monochrome so they can go straight into lecture slides. Information is separated by value contrast alone, so it reads in black-and-white print and on low-resolution projectors.

Learning roadmap

Goal	Recommended path	Est. time
I need to make a short-form video now	PART 1 → 3 → 5 → 7 → 9	2 weeks
Using it as a university course textbook	PART 12 onward in order; see Appendix H	One semester
I've been assigned an ad video to plan	PART 2 → 8 → 7 → 9	3 weeks
I want to move into motion graphics	PART 1 → 5, focus on the After Effects chapter	6 weeks
Preparing immersive content or an exhibition	PART 6 → 8 → 10	3 weeks
Job hunting is urgent	PART 10 first, then weak parts in reverse order	4 weeks

Stage	Time	What you should be able to make	Criterion
Entry	1–2 months	1-minute vlog, captioned informational short-form	Are exposure and sound consistent?
Basic	3–4 months	15-second ad, 6-cut storyboard	Do the cuts connect with intent?
Intermediate	6–9 months	Chroma key composite, 3D title, graded final	Does the composite blend into the frame?
Professional	1 year +	Deliverable from a client brief	Does it finish on schedule and on budget?
Expert	2 years +	Running a team, setting creative direction	Can you judge other people's work?

30 questions to ask first

Skim this list before the main text. These are the questions that come up again and again in class and in advising; if one is on your mind now, jump straight to the chapter in parentheses. The book is designed to be read in order or entered from a question.

Q01 **Should I buy a camera first, or lights?**
Lights. On the same budget, an entry camera with lighting beats a high-end camera without it. (PART 4)

Q02 **Can I make commercial video on a smartphone?**
Yes, provided you turn off auto exposure and auto white balance and use an external mic. (3.13)

Q03 **24fps or 30fps?**
24 for emotional ads and brand films; 30 is the safe choice for informational and caption-heavy videos. (3.8)

Q04 **Do I really need 4K?**
Shoot 4K even if the final is FHD. It leaves room for reframing and vertical crops. (3.7)

Q05 **Is log always better?**
Only when you will grade in post. For chroma key shoots it is actually a disadvantage. (3.10)

Q06 **Which editing program should I learn first?**
By domestic hiring standards, the Premiere Pro and After Effects combination. (5.3)

Q07 **Can I cut in After Effects?**
Not recommended. A tool that handles time horizontally and a tool that handles layers vertically have different jobs. (5.5)

Q08 **My composites keep looking pasted on**
Check three things: black level, atmospheric perspective, grain. (5.7)

Q09 **How far should color grading go?**
Match exposure and white balance, match shot to shot, then apply the look. The order matters. (5.8)

Q10 **Where do I get music?**
Subscription license libraries are safest. Keep the purchase record in the project folder. (4.9)

Q11 **Is a short clip fine, copyright-wise?**
No such rule exists. It is infringement regardless of length. (7.7)

Q12 **I can't draw storyboards. What do I do?**
Drawing skill is not required. Boxes and arrows suffice; the notation rules matter more. (2.1)

Q13 **What do I do when planning stalls?**
Write down 20 pain points of the target and pick the ones the product solves. The safest method. (2.5)

Q14 **Can't I fit two messages into 15 seconds?**
Both vanish. Keep one. (7.1)

Q15 How do I build the first 3 seconds?

Pick one of the six types, and never open with a logo and a fade. (7.2)

Q16 I'm not getting views

Check reach, click-through, retention and engagement, in that order, and the cause narrows. (8.8)

Q17 How long should a title be?

40–60 characters, with the key words in the first 25. (8.11)

Q18 How many hashtags?

Mix large, medium and small ones, around 10–15. (8.4)

Q19 Can I just crop horizontal footage for vertical?

Shoot 4K and mark vertical guides at the shooting stage. The composition itself changes. (6.2)

Q20 Where do short-form captions go?

Center, about one third up from the bottom. The top 12% and bottom 20% are covered by UI. (6.3)

Q21 Can I make a whole video with AI?

Replace the entire process and consistency collapses. Limit it to three points: ideation, drafts, automation. (8.9)

Q22 Do I have to disclose AI use?

Disclosure requirements are growing in competitions and client deliveries. Record your usage in the documents. (8.9)

Q23 How many pieces in a portfolio?

5–8. Your weakest piece is read as your level. (10.3)

Q24 I have no experience. What do I put in?

Finished personal work and its process material. Commissioned work is not the only kind that counts. (10.3)

Q25 How long should a showreel be?

60–90 seconds. Past 2 minutes nobody watches to the end. (10.4)

Q26 What gets asked most in interviews?

"Walk us through one portfolio piece." Answer in order: intent, problem, solution, result. (10.6)

Q27 Where is a good first job?

An organization small enough to observe the whole process. Your first role is not your final identity. (10.1)

Q28 When should I go freelance?

After you have three months of living costs saved and can write a quote and a contract. (10.10)

Q29 The revision requests never end

Because the contract did not state the number of revisions. Usually limit it to 2–3. (9.5)

Q30 I feel like I've plateaued

Work on your sound. It is the fastest improvement when you've been staring only at the picture. (4.10)

Prologue · BEFORE YOU SHOOT

0 The basic units of the screen

First, get hold of the ten words you need to read this book: frame, aspect ratio, resolution, frame rate, shutter, cut, scene, sequence, take and platform specs. It is a short, four-page dictionary, but every sentence in the PARTs that follow is built on these words.

Prologue The basic units of the screen

0.1 Frame and aspect ratio

The frame is the border formed by the screen's four edges; the aspect ratio is the relationship between its width and height. These two decide, before anything else, what goes in and what gets cut.

Note The guides on a camera monitor preview what stays and what gets cut in the final ratio

Aspect ratio is written as width divided by height. 16:9 is 1.78; CinemaScope is 2.39. Vertical video flips the same numbers and is called 9:16.

Ratio	Typical resolution	Used for
4:3	1440×1080, 640×480	Old TVs and monitors, archive footage, deliberate retro looks
16:9	1920×1080, 3840×2160	Standard horizontal spec for broadcast · YouTube · lecture video
1.85:1	1998×1080 (DCI flat)	Flat format for theatrical screening; feels almost the same as 16:9
2.39:1 (21:9)	2048×858 (DCI scope), 2560×1080	CinemaScope, wide monitors, letterboxed ads
1:1	1080×1080	Instagram feed, carousels, profile videos
4:5	1080×1350	Vertical Instagram feed post; the feed format that fills the most screen
9:16	1080×1920	Shorts · Reels · TikTok · Stories, full vertical screen
9:21	1080×2520	Vertical LED signage, full screen on some smartphones
2:1 (360)	3840×1920, 5760×2880	Equirectangular projection for 360-degree VR video, twice as wide as tall

16:9
The horizontal standard, TV and YouTube

9:16
Full vertical screen, short-form and stories

21:9
The cinematic feel of theaters and ads

1:1
A square in the feed, carousels

Note

Change the ratio and even the same scene shows a different area and a different subject size

Term

Safe area — the inner zone for key information, in case the screen edges are cropped or covered by UI. Broadcast kept the outer 10% clear; today the spots covered by platform buttons and captions play that role.

Decide the ratio before you start shooting: shoot horizontal and crop to vertical, and 2/3 of the frame is gone. If you must deliver in several ratios, keep the subject centered with room on both sides.

Exercise 0.1

Task Turn on your phone camera's grid and, from the same spot, take one photo each at 16:9, 1:1 and 9:16. Mark what got cut off.

Tip Don't move the subject; only turn the camera. What the ratio changes is not the subject but how much of the surroundings you see.

Prologue The basic units of the screen

0.2 Resolution · frame rate · shutter

How dense each picture is, how many are shown in 1 second, how long each was exposed. These are the three numbers that set the texture of video.

1080p
1920×1080, FHD. The delivery default

4K UHD
3840×2160, four times the area of FHD

24 fps
The convention for film and brand films

30 fps
Broadcast · explainer video; 60fps for sports · slow motion

Note Video is, in the end, a series of stills; how many are shown in 1 second decides how smooth the motion is

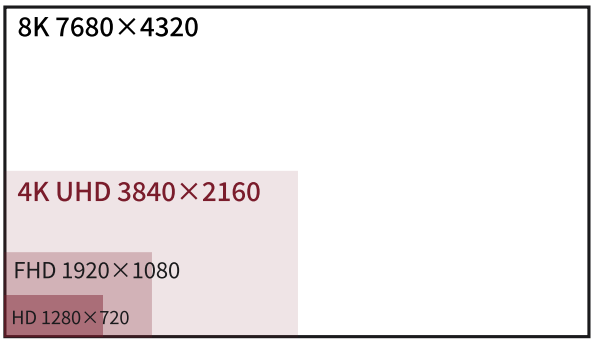
Pixels add up to a picture

16 × 9 = 144 pixels
You see dots

64 × 36 = 2,304 pixels
You see shapes

256 × 144
You see expressions

1920 × 1080 = 2.07 million pixels
FHD — the pixels disappear



Resolution = number of dots

FHD is 4 times HD, 4K is 4 times FHD, 8K is 4 times 4K

At the same screen size, more dots look sharper; with the same number of dots, a bigger screen looks coarser (LED pitch)

Shoot in 4K and deliver in FHD, and you can crop in up to two times and stay sharp

Figure 1 Resolution and pixels — the same photo drawn with 144, 2,304, 36,000 and 2.07 million dots. The moment the dots disappear is "image quality."

Resolution

Number of dots

- Width×height in pixels. 1920×1080 is about 2.07 million
- Higher stays crisp even when shown large, but files get bigger
- Choose to suit screen size and viewing distance

Frame rate

Frames per second

- Written as fps. 24 for film, 30 for broadcast, 60 for sports and games
- Shoot high and play back slow for slow motion
- Keep one value throughout a project

Shutter

Exposure time per frame

- Slow shutter speed makes motion smear; fast makes it stutter
- 180-degree rule — shutter speed at twice the frame rate (for 24fps, 1/48 s)
- The baseline for natural motion blur

TIP

Shoot in 4K and deliver in FHD, and the edit gains room to punch in or recrop for vertical. That reframing room can only be created at the shoot.

Set the three numbers once before the shoot and keep them to the end. Change them midway and frames double up or drop out in the edit, and image quality turns uneven. Delivery specs come first; work the camera settings backward from them.

Exercise 0.2

Task Shoot the same movement once at 24fps and once at 60fps, play them side by side, and write one sentence on which looks 'cinematic' and which looks 'lifelike.'

Tip Set the shutter speed to 1/48 s and 1/120 s respectively, and you see the difference made by frame rate alone.

0.3 Cut · scene · sequence · take

These are the units for counting video. If the set and the edit suite don't use the same words, people picture different things for the same scene.

Note

On the edit timeline, one clip is a cut, a same-color group is a scene, and a group of groups is a sequence

01
Frame

A single still picture. A 15-second ad at 24fps is 360 frames

02
Cut (shot)

One unbroken run of the camera. A 15-second ad usually has 6–12 cuts

03
Scene

A group of cuts at the same place · same time. Counted as the kitchen scene, the street scene

04
Sequence

A group of scenes forming one event. A 15-second ad is usually a single problem–solution sequence

Cut — the unit of editing

- One continuous stretch of picture in the finished piece
- What the editor cuts and joins
- "Lots of cuts" means a fast editing rhythm

Take — the unit of shooting

- One attempt at shooting a cut. Take 1, take 2
- Every "one more" on set adds a take
- Editing means choosing one of several takes

Coverage means shooting a scene broken into several sizes and angles. Only with a wide cut showing everything, a medium cut on the people and close-ups of faces and hands does the edit suite have choices. A scene shot without coverage can't be edited; it has to be reshot.

Exercise 0.3

Task Pick a 15-second ad you like, count its cuts, and make a table of how many scenes it divides into.

Tip Pause every time the picture changes. Consecutive cuts in the same place belong to one scene.

Prologue The basic units of the screen

0.4 Horizontal, vertical and platform specs

The same video gets a different ratio, length and covered area depending on where it is posted. The platform is not the last variable in planning; it is the first condition.

Note A vertical frame shows faces and hands large but gives up the context on either side

Platform	Ratio	Max length	UI-covered area	Notes
YouTube	16:9	Effectively unlimited (15 min by default, 12 hours if verified)	Progress bar and captions at the bottom	The thumbnail acts as the first cut
Shorts · Reels · TikTok	9:16	Shorts 3 min, Reels 3 min, TikTok 10 min	Button column on the right; account name · caption · music at the bottom	Key info at upper center

Platform	Ratio	Max length	UI-covered area	Notes
Instagram feed	4:5 · 1:1	Videos of 60 s or more become Reels	Nothing covered in the feed; watch top and bottom margins	4:5 takes up the most screen
Carousel	1:1 · 4:5	Up to 10 cards	Left and right swipe arrows	One message per card
TV	16:9	Ads 15 · 30 s; programs by time slot	Broadcast safe area (outer 10%)	Rules on caption size · position
Cinema	2.39:1 (1.85:1)	No limit on running time	None; letterbox bars only	Delivered as DCP
Vertical LED	9:21	15–30 s on loop	Bottom may be blocked, depending on mounting height	Design it to read without sound

Note

Platforms change length limits and UI layout often. Recheck the platform's current specs right before delivery.

Horizontal video often moves from the situation in to the person; vertical often starts with the person and adds the situation after. To make both formats from the same material, don't just crop; restructure.

Reading order for this book

This book puts practice ahead of theory. First you learn to read the screen in the language of video, decide what to shoot through planning (storyboard · PPM), then finish a piece through shooting, lighting · sound and editing, in that order. Next come media specs, ad cases, platforms, industry · careers and the AI shift, and finally a return to history, theory and media art. History and theory read after you have made something with your own hands become things you can explain, not things to memorize.

Exercise
0.4

Task

Take a screenshot of a video on the platform you watch most, shade in the areas covered by buttons · captions · account name with a pen, and estimate and note what share of the screen is left as safe area.

Tip

Covered areas vary by device and app version. Note the figures for your own device and you can use them in your next plan right away.

MEMO · PROLOGUE

PART

01

What you make in this PART

1. Contact sheet of one person in 8 shot types
2. Edited dialogue scene that keeps the 180-degree rule
3. Cut analysis sheet for a 30-second ad

The language of video

The moment we turn on the camera, we decide at once where to stand, what to include and how much, and how long to show it. What separates good video from bad is not the gear but the precision of these decisions. This PART is where you learn the grammar of those decisions by heart, through pictures.

Photo P-02 A director framing with their hands — framing is the first decision · generative image

Using this chapter in class

Name shot sizes and angles by abbreviation and choose them to fit the intent

Materials Smartphone, tripod, printout of the shot-size plate

10 min	15 min	10 min	10 min	5 min
Intro	Concept	Plates	Exercise	Wrap-up
Show the same scene in two sizes for comparison	8 shot types, 5 angle levels, 3 rules of framing space	Put numbers on framing with the diagram of cut lines on body proportions	2 students to 1 team: shoot 8 sizes, fill in a comparison chart	Confirm the rule: never cut at a joint

> Check point
>
> Footage matches the 8 abbreviations exactly

PART 01

Introduction

The moment we turn on the camera, we make three decisions at once: where to stand, what to include and how much, and how long to show it. Together these decisions become meaning. What separates good video from bad is mostly not the gear but the precision of these decisions.

The language of video works like grammar. A close-up demands emotion; a long shot explains the situation. A low angle makes the subject big; a high angle makes it small. This is not taste but a convention audiences have learned over 100 years. Know the conventions and you can convey information without explanation; once you know them, you can also break them on purpose. Break rules you don't know and it just reads as a mistake.

Everything in this part can be practiced today, even without gear. Shooting one person in eight sizes on a single smartphone, and shooting the same conversation from two angles to compare: these are the real goals of this chapter. Knowing from reading and knowing from shooting are entirely different kinds of knowledge.

Background 2

How film grammar was made

Shots, cuts and angles were not rules fixed from the start. Conventions early filmmakers discovered one by one, watching how audiences reacted, piled up into today's film grammar.

The Lumière brothers' first screenings in 1895 were mostly single-shot films from a fixed camera. The camera stayed in one place, like a seat at a play. In the same period, Georges Méliès used the trick of stopping the camera and starting it again to show that film could not only record reality but create a new one. Record and fantasy: these two branches live on today as documentary and VFX.

Telling a story by joining cuts developed fast in the early 1900s. Edwin Porter's The Great Train Robbery (1903) joined events in different places into a single chase. D. W. Griffith made systematic use of cross-cutting, close-ups that heighten emotion, and a rhythm that varies cut length with the pace of events. But his The Birth of a Nation (1915) is still sharply criticized for its racist content. Innovation in form does not guarantee the legitimacy of content.

Soviet filmmakers gave editing even more weight. Lev Kuleshov presented an experiment showing that when the same actor's blank face is joined to different scenes, audiences read entirely different emotions. Sergei Eisenstein argued that the collision of two cuts produces a new meaning found in neither, and divided montage into metric · rhythmic · tonal · intellectual montage. Today's ads that rapidly intercut a product with symbolic images stand on this tradition.

The Hollywood studio system, by contrast, chose editing that goes unnoticed. Rules that keep audiences from confusing space and time, like the 180-degree rule, eyeline match and match on action, were refined, and David Bordwell summed this up as the classical Hollywood style. Most of the continuity editing rules in this PART come from here.

In 1960, Jean-Luc Godard's Breathless deliberately broke these rules with jump cuts that skip time within the same framing. The jump cut, so common on YouTube today, was once revolutionary grammar. Film grammar is not a fixed code of law but a language audiences and makers have agreed on together, rewritten a little with every new platform.

Further reading — David Bordwell · Kristin Thompson, Film Art; Sergei Eisenstein, Film Form; Louis Giannetti, Understanding Movies

PART 01 The language of video

1.1 Shot, scene, sequence: the units of video

Video has a hierarchy, like sentences. Mix up scene and cut in a storyboard meeting and the shooting schedule itself goes wrong.

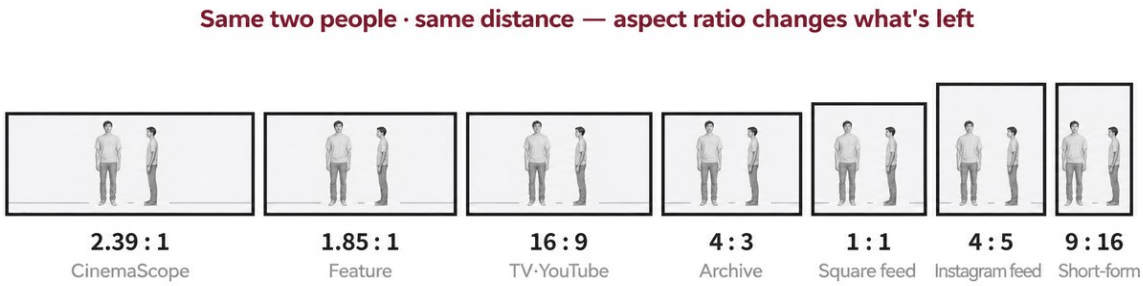


Figure 2 Frames by aspect ratio — the same two people, different negative space

Term

By convention, it is called a shot during shooting and a cut during editing.

Frame

Frame

- A single still image; the smallest unit of editing and timecode
- At 24fps, 1 second = 24 frames

Shot

Shot

- Footage recorded without a break from when the camera rolls until it stops

Scene

Scene

- Events grouped by same place · same time
- A change of place or time means a new scene; the basic unit of a screenplay

Sequence

Sequence

- A group of scenes leading toward one purpose
- A whole chase, preparation or flashback

Take

Take

- Each repeated attempt at the same shot
- Take 3 is the third attempt

Coverage

Coverage

- How fully a scene is secured in different sizes and angles
- Too little leaves no options in the edit

On-set notation example

S#12 / C#04 / T3 means scene 12, cut 4, take 3. Just writing this correctly on the slate cuts editing time in half.

Exercise 1.1

Task	Pick a sequence from a film you like and break it into shots · scenes · sequence in a table.
Tip	Shots divide where the cut changes; scenes divide where time or place changes.
Assessment	Accurate division into units; length of each shot recorded
Model answer	Plots shot lengths as a bar graph to make the scene's rhythm visible.

PART 01 The language of video

1.2 8 shot types by distance

Classified by the distance between camera and subject, this is the first classification to memorize. What you show, and how much, decides what the audience feels.

Reference photos 1.2A Generated images — staging reference

Extreme long shot ELS

The space is the star, the person a dot — openings and establishing place; isolation and scale

Long shot LS

Full figure and surroundings — setting the scene; explaining the situation, objectivity

Full shot FS

Head to toe — for watching a whole action, such as dance, movement or costume

Reference photos 1.2B Generated images — staging reference

Knee shot NS

From the knees up — moving during dialogue; a balance of action and expression

Medium shot MS

From the waist up — the default for interviews and dialogue; neutral and everyday

Bust shot BS

From the chest up — news and testimonial ads; trust and warmth

Reference photos 1.2C Generated images — staging reference

Close-up CU

The whole face — reaction cuts and decisive expressions; emotion and focus

Extreme close-up ECU

Eyes, mouth, part of a product — where texture is proven; tension and emphasis

Insert

Hands and objects — a support cut that rescues awkward joins

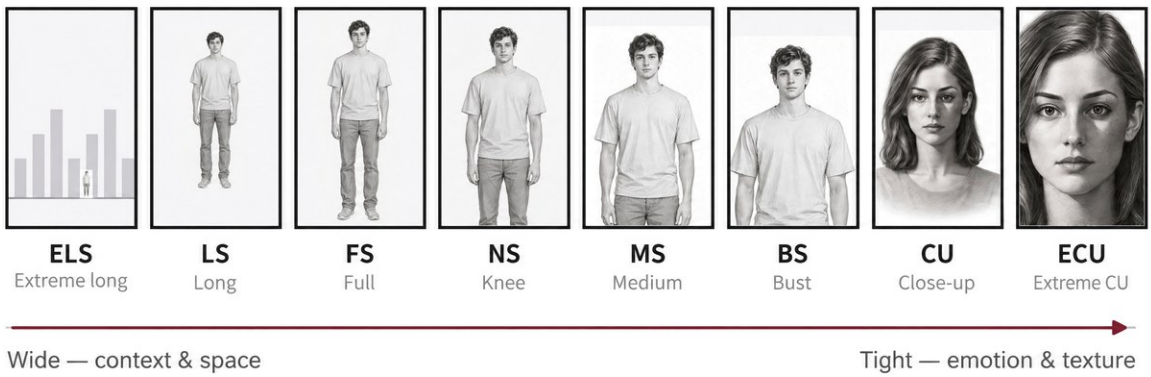

Figure 3 8 shot types by camera-to-subject distance

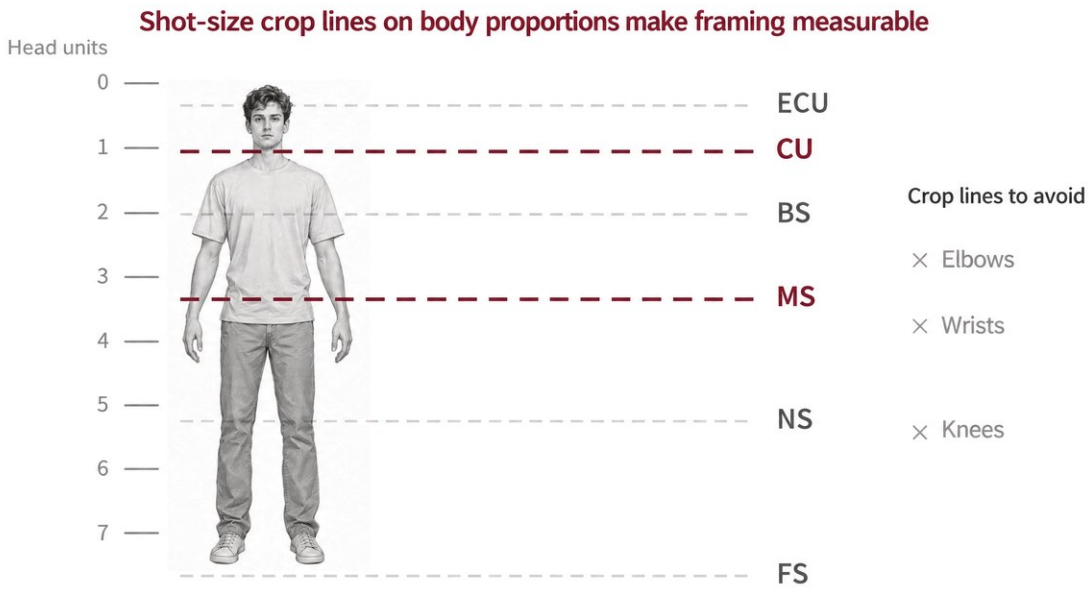

Figure 4 Shot-size cut lines on body proportions

G-01 8 shot sizes — same person, same place, only the distance changes

Abbr.	Name	In frame	Effect	Main use
ELS	Extreme long shot	Whole space; the person is a dot	Isolation, scale, opening a story	Openings, establishing place
LS	Long shot	Full figure, lots of background	Context, objectivity	Setting the scene
FS	Full shot	Head to toe	Observing the whole action	Dance, movement, costume
NS	Knee shot	Above the knees	Balance of action and expression	Moving while talking
MS	Medium shot	Above the waist	Neutral, everyday	Default for interviews, dialogue

Abbr.	Name	In frame	Effect	Main use
BS	Bust shot	Above the chest	Trust, closeness	News, testimonial ads
CU	Close-up	Whole face	Emotion, focus	Reaction cuts, key expressions
ECU	Extreme close-up	Eyes, mouth, part of a product	Tension, materiality, emphasis	Product texture, dramatic moments

Note

Size is set by where the frame cuts, not by how big the person is. Even on a telephoto, a frame cut at the chest is a bust shot. Focal length and shot size are separate things.

Rules for changing size

01 Make consecutive cuts differ by at least two sizes. Going straight from MS to NS just feels like a jump.

02 Showing the space wide, then closing in step by step, is the most stable build. Start on an ECU and widen out, and you create curiosity.

03 Close-ups have power only when rationed. In a 15-second ad, 2 cuts at CU or tighter is about right.

04 In a product ad, the ECU is where you prove texture. If surface, grain, droplets or sheen don't show, there's no reason for an ECU.

Reference photos 2.2D Generated images — the same 8 shots, different people · different places. Learn them by the figure's height in frame

Extreme long shot ELS The space is the star, the person a dot

Long shot LS Full figure and surroundings

Full shot FS Head to toe

Knee shot KS Above the knees

Medium shot MS Above the waist

Bust shot BS Above the chest

Close-up CU The whole face

Extreme close-up ECU The eyes

Exercise 1.2

Task	Shoot all 8 shot sizes of the same person in the same place and make them into one contact sheet.
Tip	Leave the camera alone and change only the lens or distance; the differences become clearer. Keep the headroom constant.
Assessment	Shot boundaries (no cutting at joints), consistent headroom · lead room
Model answer	For each shot, write one line on "what only this size conveys."

PART 01 The language of video

1.3 Shots by number of people

In a two-shot, the physical distance between two people reads as psychological distance. It's the first value to adjust when showing family, lovers or colleagues.

Reference photos 1.3A Generated images — directing reference

One-shot 1S

One person's judgment and emotion — when focusing on an individual's decision

Two-shot 2S

Distance between two = distance in the relationship — a finger's gap and touching shoulders tell different stories

Group shot G.S

A small group of four or more — team, family, colleagues

Physical distance reads as relational distance

1S one-shot
One person — emotion and focus

2S two-shot
Two people — relationship, the dialogue default

3S three-shot
Three people — the middle one is the axis

G.S group shot
Many — group, mood, scale

> Each added person widens the shot a step — 1S at medium close-up, 2S · 3S at medium, groups at medium long. The **distance** between people reads as relational distance.

Figure 5 Shots by number of people — same studio, same camera height, based on a 16:9 medium shot.

Name	Abbr.	Composition	Meaning
One-shot	1S	Only one person in frame	Focus on one person's emotion and judgment
Two-shot	2S	Two people together	States relationship, conflict, intimacy visually
Three-shot	3S	Three people together	Triangular; balance and exclusion at once
Group shot	G.S	Small group of four or more	Team, family, colleagues
Crowd shot	Crowd	Many, anonymous	Scale, energy, social context

Exercise 1.3

Task Shoot the same dialogue scene as a one-shot, two-shot, three-shot and group shot, and compare how the relationships read.

Tip Deliberately vary the distance and height difference between the people.

Assessment Does composition reveal intimacy, conflict or exclusion?

Model answer Put one person alone at the edge of the frame to show exclusion without a word.

PART 01 The language of video

1.4 Shots by situation

These are shots by function, the ones that make a scene work. In every scene, always get 1 master shot and at least 2 inserts.

Reference photos 1.4A Generated images — directing reference

Over-the-shoulder OSS

Dialogue past a shoulder — the dialogue standard, conveying relationship and viewpoint at once

Point-of-view shot P.O.V

What the character sees — works only after a cut of them looking; 1st-person immersion and fear

Reaction shot

The listener's face — emotion travels through reactions more than dialogue

Reference photos 1.4B Generated images — directing reference

Establishing shot

Sets place and time — without it, the audience is busy inferring the space and can't focus on the story

Insert

The decisive detail — hand, watch, text message, product label. The editor's savior, slipped in to fix an awkward join

Cutaway

Time compression and mood — a cut to something outside the main action

Reference photos 1.4C Generated images — three cameras for a dialogue scene

Over-the-shoulder

To show a relationship while putting us on one side — the audience feels seated inside the conversation. Around 50mm, near shoulder soft

POV shot

To show exactly what the character sees — the audience becomes the character's eyes, and when the other person looks into the lens, it feels like they're talking to us. Normal angle of view at eye height

Reaction shot

When the reaction, not the words, carries the emotion — the audience reads a line's weight in the listener's face. Short tele around 85mm, eyes just off the lens

Note An establishing shot must answer three questions in one cut — where (the kind of neighborhood), when (evening light), who (the people behind lit windows). Miss one and the audience spends the next cut working out the space and loses the story.

Establishing

Establishing shot

- Place · time · blocking at once, at the top of a scene

Reverse

Reverse shot

- The opposite-angle cut to an OSS or POV shot
- Alternate them for dialogue; the 180° rule is a must

Master

Master shot

- The whole scene, start to finish, at one size
- The edit's safety net; a must for beginners

A must-have habit on set

In every scene, always get 1 master shot and at least 2 inserts. Drop them for lack of time and you will regret it in the edit.

Exercise 1.4

Task	Shoot a 30-second scene that includes over-the-shoulder, POV, insert and reaction shots.
Tip	Shoot reaction shots longer than the lines. They get used most in the edit.
Assessment	Does each shot's function survive the edit?
Model answer	Use POV and inserts so the audience learns what the character learns, at the same moment.

PART 01 The language of video

1.5 Angle: the power of camera height

Camera height sets a character's status. Limit a piece to two or three angles so each keeps its meaning.

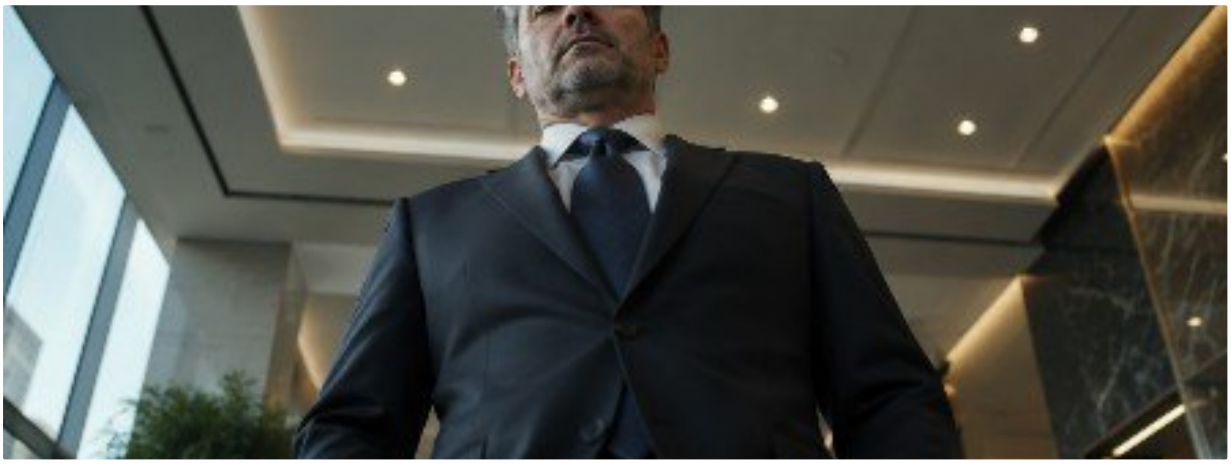
Reference photos 1.5A Generated images — directing reference

Eye level

Neutral and equal — the default for dialogue and interviews; safest but flat

High angle

Small and vulnerable — trouble, cuteness, summing up. Can read as belittling



Low angle

Authority and menace — hero products, strong characters. Watch for ceiling and lights in frame

Reference photos 1.5B Generated images — directing reference

Bird's-eye

Straight down — cooking, unboxing, maps. Diagrammatic, but no facial expression

Dutch angle

Tilted unease — rising tension, hallucination. Overuse looks juvenile

Worm's-eye

Looking up from the ground — vehicles, buildings, monsters. Overwhelming and alien; protect the lens

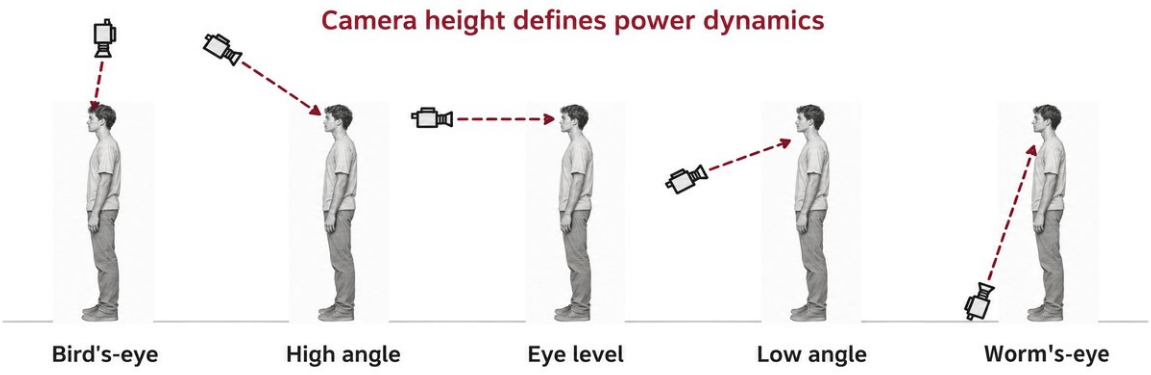


Figure 6 5 angles by camera height

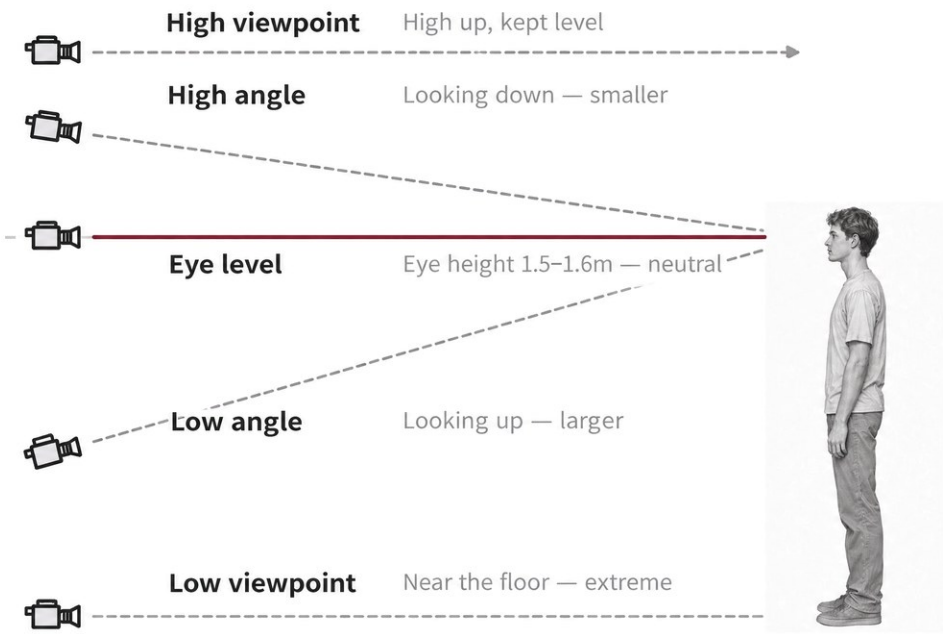

Figure 7 Side view of 5 camera heights

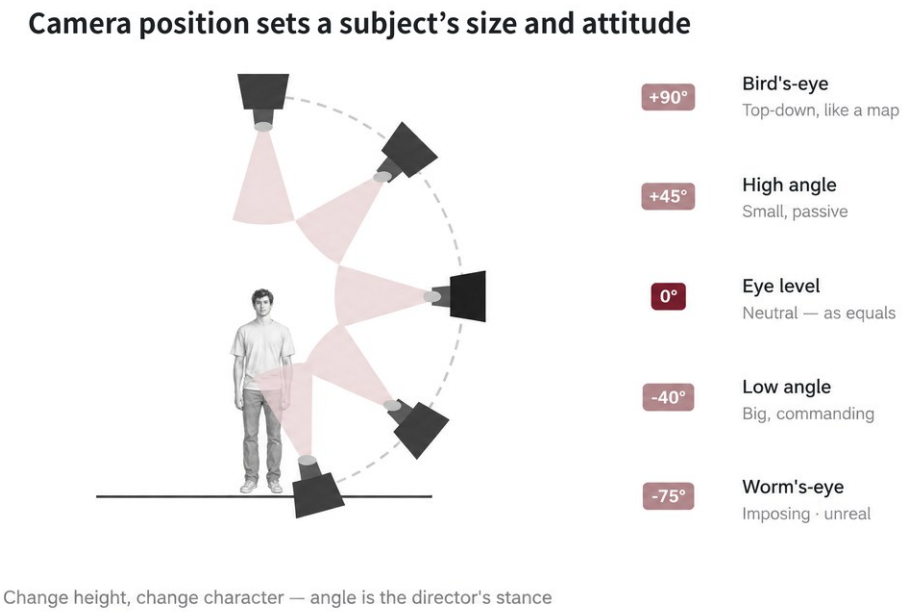

Figure 8 Camera positions around the subject

G-02 The psychology of angle — high · eye level · low angle

Angle	Camera position	Psychological effect	Typical use	Note
Eye level	Subject's eye height	Neutral, objective, equal	Default for dialogue, interviews	Safest but flat
High angle	Looks down from above	Small, vulnerable, observed	Trouble, cuteness, summing up	Can read as belittling
Low angle	Looks up from below	Authority, menace, heroism	Hero products, strong characters	Watch for ceiling and lights
Bird's-eye	Straight down	Diagrammatic, omniscient	Cooking, unboxing, maps	Can't show expressions

Angle	Camera position	Psychological effect	Typical use	Note
Dutch angle	Tilted frame	Unease, distortion, wrongness	Rising tension, hallucination	Juvenile if overused
Worm's-eye	Looks up from the floor	Overwhelming, alien	Vehicles, buildings, monsters	Protect the lens

TIP

The basic grammar of product ads: the product big in a low angle, scenes of use friendly at eye level, results clear from a bird's-eye.

Limit a piece to two or three angles. Six angles in 15 seconds and their meanings cancel each other out.

Exercise 1.5

Task Shoot the same person at high · eye-level · low angles, then ask viewers their impression of the person and record it.

Tip Measure angle from the subject's eye height.

Assessment Did you explain how angle maps to impression, with evidence?

Model answer The low angles of Citizen Kane. Shift the angle within one scene to show a power relationship flipping.

Background 3

How does the eye read the screen?

The rules of composition come from human visual perception before they are art-textbook conventions. Know how the viewer's eye moves, and composition stops being a formula to memorize and becomes a tool you can design with.

In the early 20th century, the German Gestalt psychologists Max Wertheimer · Wolfgang Köhler · Kurt Koffka argued that we don't add up parts to see a whole; we grasp the whole first. Things close together are seen as a group (proximity), similar things as belonging together (similarity), broken lines as continuous (continuity), and open shapes are completed as closed ones (closure). Put two people close together in frame and the audience reads them as being on the same side, no explanation needed.

In "Rubin's vase," introduced by Edgar Rubin in 1915, the same lines read as a vase or as two faces looking at each other. The eye makes only one thing the figure at a time. Controlling focus, brightness and color contrast in video is ultimately telling the audience what the figure is right now. Blurring the background

with shallow depth of field and lighting only the person work on the same principle.

In Art and Visual Perception, Rudolf Arnheim described invisible forces at work in the frame. A rectangle's center, corners and diagonals hold a tension that pulls the eye, and the further an object strays from center, the less stable it feels. That balance of forces is why the rule of thirds feels comfortable and a figure pressed against the edge feels cramped. Composition is not finding the right answer but adjusting how much tension and stability there is.

In eye-tracking experiments in the 1960s, Alfred Yarbus showed that the eye moves over the same picture in entirely different ways depending on the question the observer is given. Asked to estimate the people's ages, observers look at faces; asked about their finances, at clothes and furniture. The audience's gaze follows not just shapes but the questions the story asks. Plant the question "who is coming in?" in one cut, and in the next the audience looks at the door first.

So composition and eye guidance can't be separated from editing. Put the next cut's key subject where the eye came to rest in the last, and the cut flows; put it deliberately on the opposite side, and you get a jolt. Whenever you meet a rule in this chapter, also ask: "where is the audience's eye right now?"

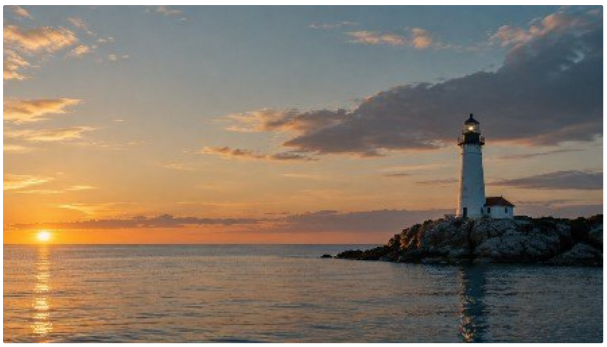
Further reading — Rudolf Arnheim, Art and Visual Perception; Bruce Block, The Visual Story; Margaret Livingstone, Vision and Art

PART 01 The language of video

1.6 Composition: placement within the frame

Composition is the decision of where to put the subject, and empty space is that decision's name. Secure room for captions and logos before you shoot.

Reference photos 1.6A Generated images — directing reference



Rule of thirds

Eyes on an intersection — the most stable, least likely to fail. Turn on the camera grid

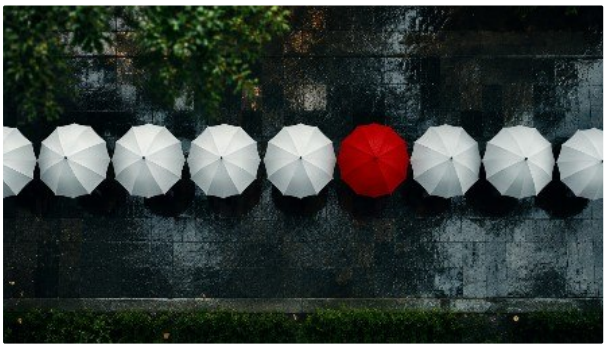
Golden ratio

Into the spiral's center — suits natural forms and curved subjects

Central symmetry

Declarative and head-on — brand logo cuts, frontal interviews, authority

Reference photos 1.6B Generated images — directing reference



Rhythm and repetition

Make one different — repeat a shape for rhythm, then break it once to point up the subject

Leading lines

Toward the vanishing point — roads, corridors, stairs. The fastest way to explain space in a short cut

Frame within a frame

A trapped gaze — door frames, windows, mirrors focus the eye and suggest confinement at once

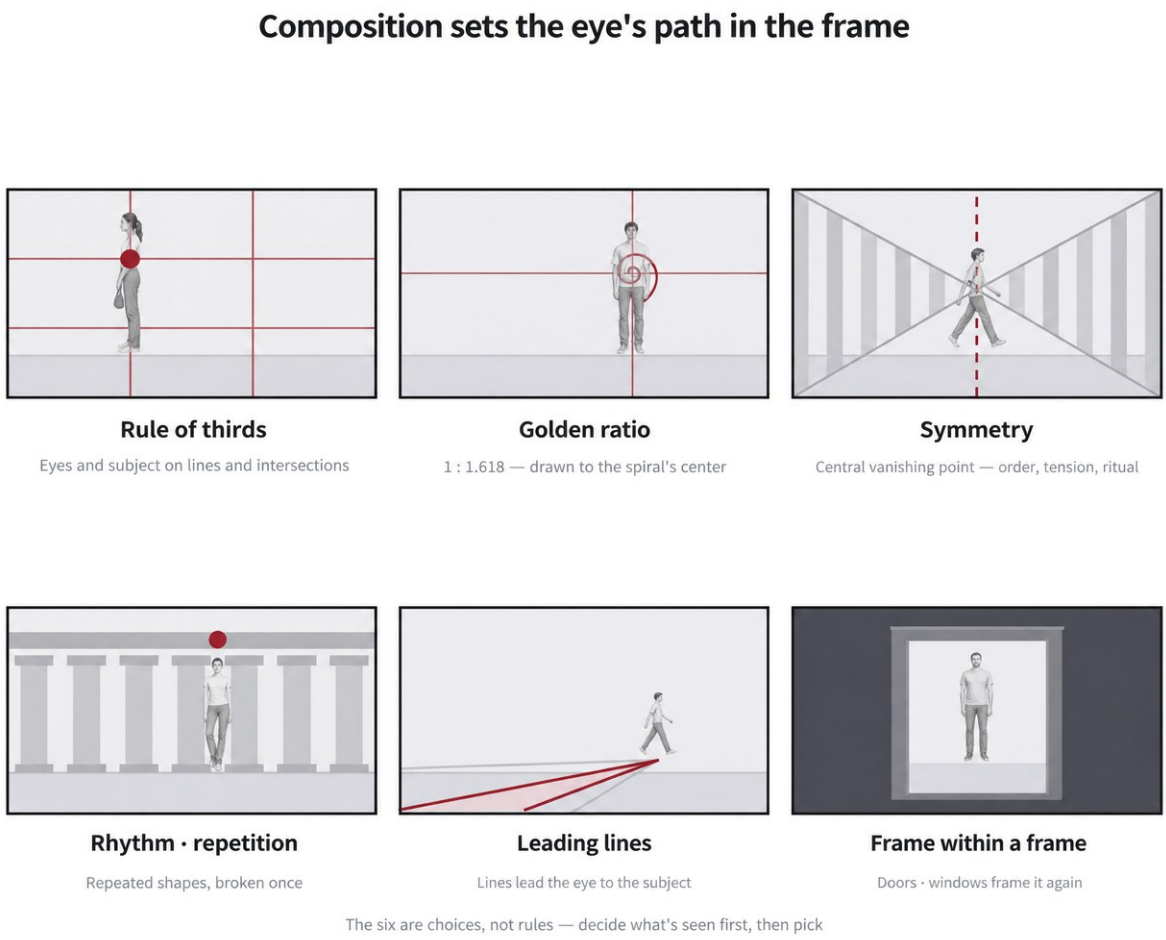


Figure 9 Six principles of composition — thirds · golden ratio · symmetry · rhythm · leading lines · frame within a frame

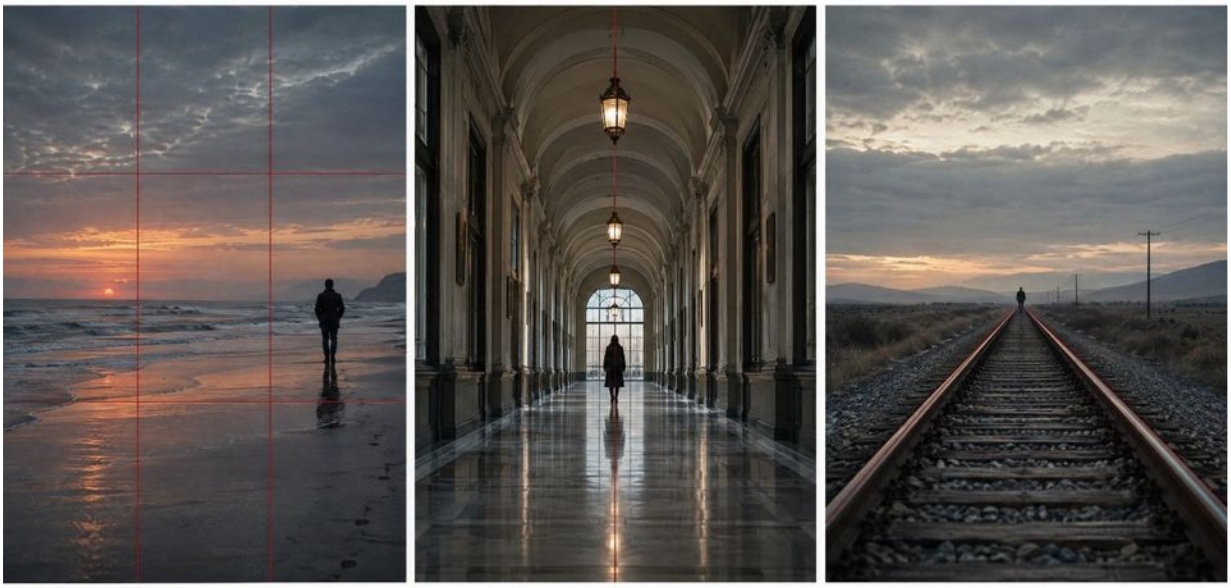


G-03 Composition principles — thirds · symmetry · leading lines

Basic composition principles

Basic
Rule of thirds
- Main subject where the 3-way grid lines cross
- Most stable, low risk of failure

Declarative
Central symmetry
- Dead center; declarative and strong
- Logo cuts, frontal interviews, authority

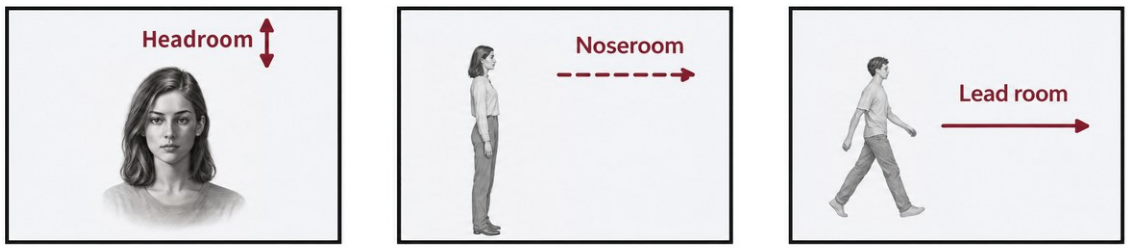
Curve
Golden ratio
- A spiral draws the eye inward
- Natural forms, curved subjects

Motion
Diagonal
- Lines across the frame create motion
- Gives speed to a static product

Stability
Triangle
- Three elements in a triangle
- Three-shots, product displays

Horizon
Horizon placement
- Top 1/3: stresses the ground
- Bottom 1/3: sky and openness

Three names for space



Space above head
Too much sinks, too little cramps

Space ahead of gaze
Leave room where they look

Space ahead of motion
Leave room where they go

Figure 10 Headroom, nose room, lead room — three names for space

Note

In ads, negative space is where captions and logos go. Secure it before the shoot; it can't be made in post-production.

- **Headroom** — space above the head. Too much and the person sinks; too little and it feels cramped. In a close-up, cropping above the forehead actually looks more natural.
- **Nose room (looking room)** — space in front of the gaze. If there's more space behind the gaze, the audience feels uneasy for no clear reason.
- **Lead room** — space ahead of a moving subject. Too little and it seems about to hit a wall.
- **Negative space** — space left empty on purpose. It's where captions and logos go.

Advanced composition techniques

- **Frame within a frame** — use door frames, windows, mirrors or fingers to make a second frame inside the frame.
- **Linear perspective** — depth from the vanishing point of roads, corridors, stairs.
- **Repetition and pattern** — repeat a shape for rhythm and make one different.
- **Foreground objects** — put leaves, glass or fabric in front of the lens to add layers. Depth on a low budget.
- **Broken symmetry** — knock one element out of a perfect symmetry and the eye is forced there.
- **Layering** — place information in foreground, midground and background to pack more into one cut.

Exercise
1.6

Task	Shoot 4 stills, one each in rule of thirds, symmetry, leading lines and frame within a frame.
Tip	After shooting, also submit versions with guide lines overlaid.
Assessment	Accurate use of the principle; where the eye finally rests
Model answer	Wes Anderson's symmetry; the vertical compositions of Bong Joon-ho's Parasite. Composition carries the story's meaning too.

PART 01 The language of video

1.7 Guiding the eye and reading the frame

The audience's eye doesn't wander the frame freely. It is pulled to what is bright, moving or sharp, to faces, to high contrast. Directing is controlling that order.

Cue	How it works	Strength	In practice
Brightness	Eye drifts to brighter areas	Very strong	Only lead and product bright; background down
Movement	The only motion in a still frame	Very strong	Freeze everything else, move one thing
Sharpness	The area in focus	Strong	Clean up the background with shallow depth of field
Eyeline	Follows where the performer looks	Strong	Place just before revealing the subject
Color contrast	Complementaries, high saturation	Medium	Brand color as the only saturated one
Line and perspective	Leads toward the vanishing point	Medium	Use corridors, roads, railings
Sound	Attention turns toward the sound	Very strong	Main cue in 360 content

Where the eye must land within 3 seconds

Check for yourself where the eye lands first in a short-form opening frame. Show it to a teammate for just 0.5 seconds and ask what they saw. If you don't get the answer you intended, fix the composition.

Exercise 1.7

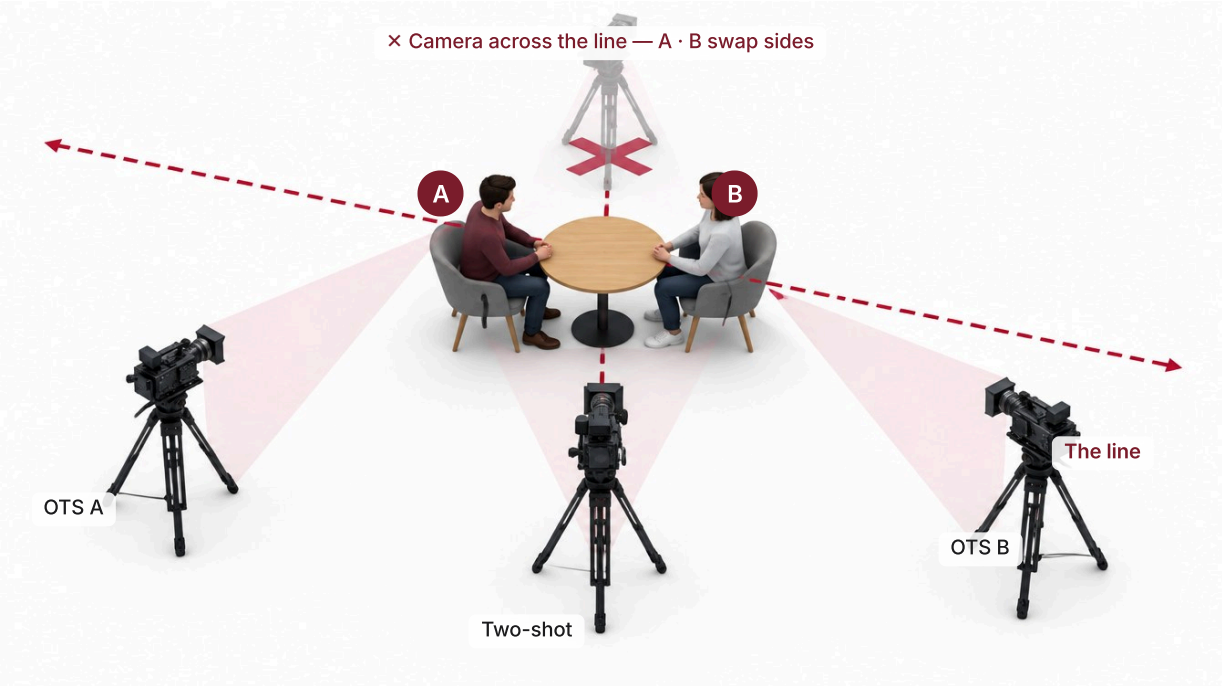
Task	Show one still to 5 people for 3 seconds and find out what they saw first.
Tip	Classify what drew the eye: brightness, focus, a face or movement.
Assessment	Did you predict the eye's path and check the results?
Model answer	The center-weighted composition of Mad Max: Fury Road. Draw the eye's path in arrows to prove the design intent.

PART 01 The language of video

1.8 The 180° rule and the 30° rule

These two rules are the minimum agreement that keeps the audience oriented in space. Only those who know the rules can break them.

Stay on one side of the line and left and right hold

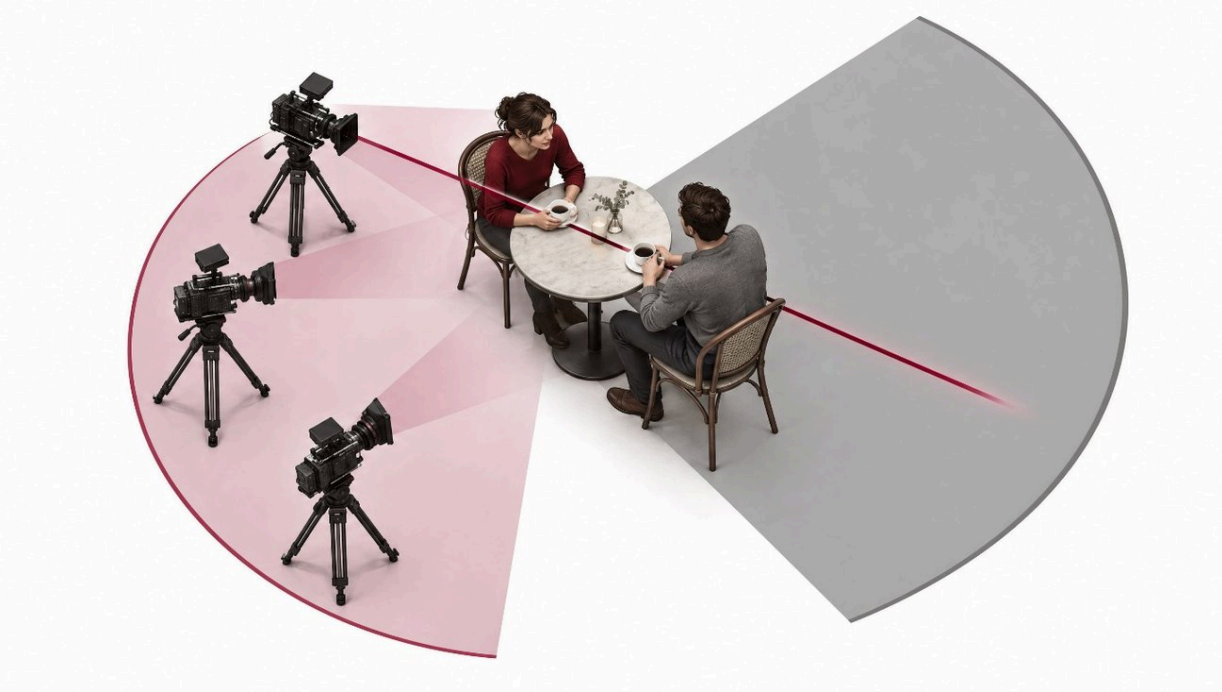


OTS A — B on the right
Over A's shoulder, B is screen right, facing left

OTS B — A on the left
Same side of the line, so A is left and B right. Cut together, they face each other

× Cut across the line — B jumps to the left
The audience reads both as looking the same way. To cross, you need a cut that shows the crossing

Figure 11 The 180° rule — keep the camera on one side of the line joining two people. Below: what the three cameras actually show.



G-04 The 180° rule — the line between two people and camera placement

The 180° rule (the line)

TIP

When you must cross the axis, go via a neutral head-on cut, a cut where the camera moves across, or an insert.

Draw an imaginary line between two people or objects and shoot from one side of it only. Cross it and the people swap sides, the dialogue falls apart, and the audience loses its sense of space.

- Break this rule in a sports broadcast and a team seems to attack the wrong way. That's why soccer broadcast cameras sit on one side only.
- The fewer the cuts, as in a 15-second ad, the more one violation wrecks the whole. Draw a floor plan at the storyboard stage and fix camera positions in advance.

Eyeline match: three checks

01 When two people look at each other — are the eyelines at the same height and in opposite directions? If A looks right, B must look left.

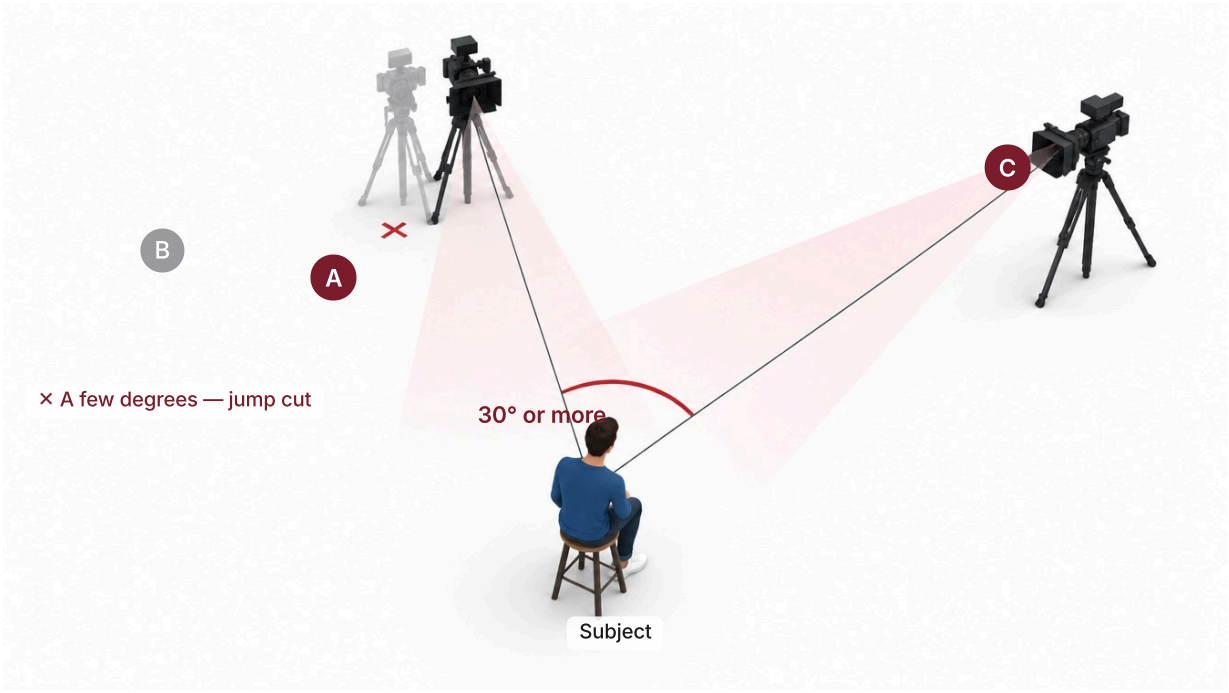
02 When someone looks into the camera — is the lens at their eye height? Higher or lower, and they look down or up at the viewer instead of at them.

03 When someone looks behind or off screen — is the next cut the space in that direction? If the gaze exits left, the next cut must be what was on the left.

The line and eyeline match are the same agreement. 1.18 Eyeline direction picks this up with five kinds of gaze.

The 30° rule

Move 30° or more around the same axis for a natural next cut



How to read it

A to C — the angle differs enough that the audience accepts "a different cut"

A to B — join two cuts from nearly the same spot and the image jumps (jump cut)

If you can't change the angle, change size by two steps — full shot → close-up

Figure 12 The 30° rule — when moving the camera, swing at least 30° around the subject. Deliberate jump cuts in short-form break this rule knowingly.

When you shoot the same subject again, change the camera angle by at least 30°. Any less and the two cuts look nearly the same and read as a jarring jump cut. Changing size by two steps as well is safer still.

> Only those who know the rules can break them. Short-form jump cuts flatly violate the 30° rule but are allowed because they serve a clear purpose: pace.
>
> 1.8 The 180° rule and the 30° rule

Exercise
1.8

Task	Edit a two-person dialogue in a version that keeps the 180° rule and one that breaks it, and compare.
Tip	Before shooting, mark the line on the floor with tape.
Assessment	Axis held, consistent eyelines, a reason for any deliberate crossing
Model answer	Cross the line on purpose only when the conflict explodes, to stage confusion.

PART 01 The language of video

1.9 Camera movement and emotion

Use one move per cut. Pan, zoom and travel all at once and the audience's eye gets lost.

Reference photos 1.9A Generated images — directing reference

DOLLY

Forward on rails — the camera passes through space, so foreground and background shift against each other. Immersion or withdrawal

ARC

Circling the subject — the person stays centered while the background revolves. A moment of resolve, a turning point in a relationship

CRANE

Vertical rise and scale — showing scale, closing out, the liberating last cut

Reference photos 1.9B Generated images — directing reference

PAN

Sweeping space by turning on a fixed axis — links one subject to another

Zoom in ZOOM I

Same viewpoint, only the image enlarges — perspective flattens and the audience feels it is "peering in"

Zoom out ZOOM O

Context revealed — artificial emphasis; only the angle of view changes

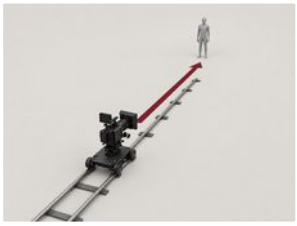
Eight ways the camera moves

01 PAN

Turns left and right in place

02 TILT

Up and down in place



03 DOLLY IN

The camera moves closer

04 TRACK

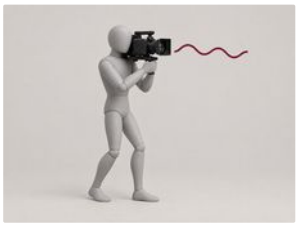
Moves alongside the subject

05 ARC

Circles the subject

06 CRANE

Rises and falls vertically



07 Handheld HH

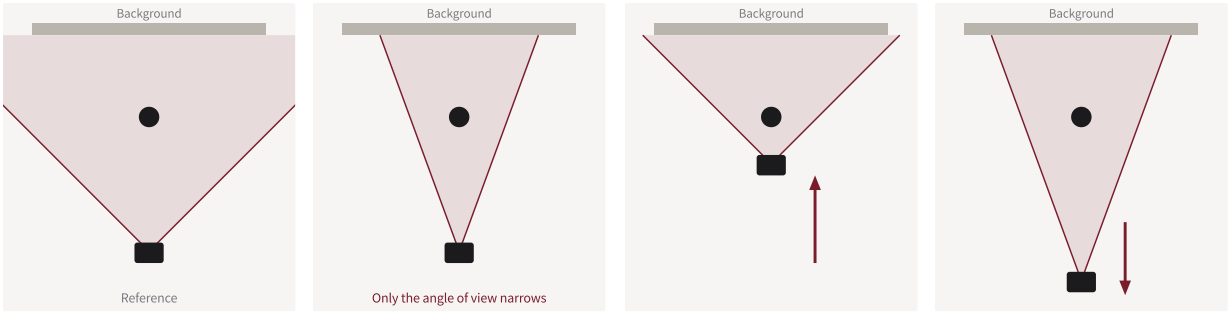
A shake that carries breath

08 LOCKED

Doesn't move — the baseline

Figure 13 Paths of the 8 camera moves. Red arrows show the camera's movement; the white figure is the subject.

A zoom changes the angle of view; a dolly changes the space



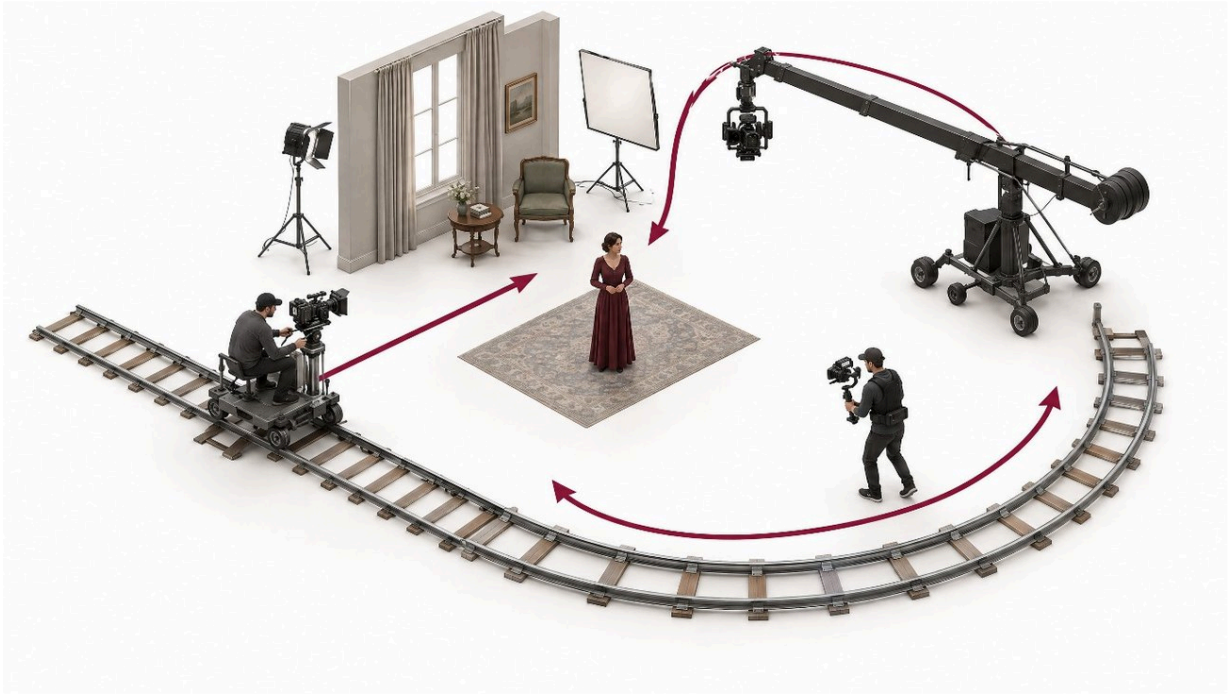
Reference frame
Person small, background wide

Person and background grow together
Perspective flattens

Person grows, background stays
Depth comes alive

Person stays, background closes in
Vertigo — dolly zoom

Figure 14 Zoom vs. dolly — same size, different space. Top row: camera position and angle of view seen from above; bottom row: the resulting frame.



G-05 Camera movement rigs and paths — dolly · crane · gimbal · arc

Dolly

- The camera physically moves
- Near subject changes a lot; far background barely
- Spatial depth comes alive

Zoom

- Only the lens's angle of view changes
- Subject and background grow at the same rate; perspective flattens
- Peering in, not approaching

Term

Dolly zoom — dolly and zoom in opposite directions at once, holding the person's size while only the background stretches or shrinks. Since Hitchcock's Vertigo (1958) it has also been called the Vertigo effect.

Move	Action	Meaning	Notation
Pan	Horizontal turn on a fixed axis	Sweeping space, linking subjects	PAN L / PAN R
Tilt	Vertical turn on a fixed axis	Stressing height, introducing a character	TILT U / TILT D
Dolly	The camera itself moves in or out	Immersion or withdrawal	DOLLY IN / OUT
Track	Moves alongside the subject	Accompanying, pursuing	TRACK L / R
Zoom	Focal length changes	Artificial emphasis	ZOOM I / O
Arc	Circles the subject	Shows a product in the round	ARC L / R
Crane	Large vertical move	Showing scale, closing	CRANE U / D
Handheld	Carried by hand	Tension, realism	HH
Steadicam	Moves on a stabilizer	Gliding alongside	STEADI
Locked-off	Completely still	Compositing base, observation	LOCKED

Choosing a move by emotion

Emotion	Suggested move	Speed	Lens	Note
Excitement, anticipation	Slow dolly in	Very slow	50–85mm	Hold 0.5 s at the end
Unease, tension	Subtle handheld	Irregular	35mm	Too much causes motion sickness
Confidence, dignity	Locked low angle or arc	Steady	24–35mm	Must stay level
Liberation	Crane up or drone rise	Gradual acceleration	Wide	Place in the last cut
Focus, resolve	Fast dolly in, snap zoom	Fast	85mm or longer	Only 1 per piece
Everyday, empathy	Locked-off or slow pan	Very slow	35–50mm	Stillness is fine

Note

As a rule, cuts planned for compositing are locked off or use only simple straight moves, to keep tracking easy.

Use one move per cut. Pan, zoom and travel all at once and the audience's eye gets lost.

Exercise 1.9

Task Shoot 5 seconds each of pan, tilt, dolly, tracking, arc and zoom, and write down the emotional effect of each.

Tip Hold still for 1 second at the start and end of a move; it makes editing easier.

Assessment Stability of the move, motivation (why it moves)

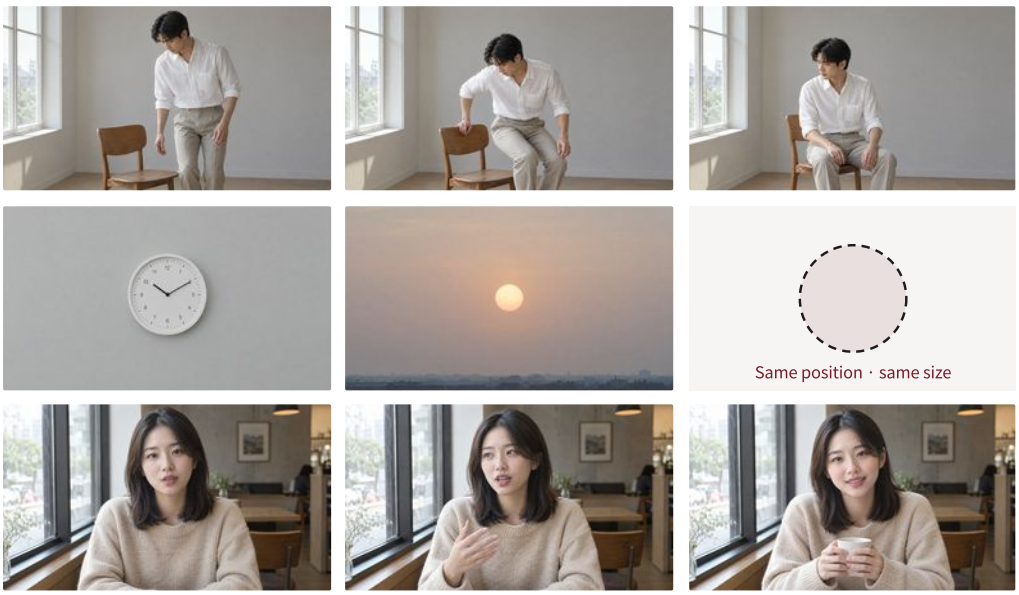
Model answer The dolly zoom in Hitchcock's Vertigo. Motivate every move with a shift in the character's emotion.

PART 01 The language of video

1.10 Types of cuts and transitions

A professional editor's work is mostly hard cuts. Polish comes from the order of cuts, not the number of effects.

Three ways to join cuts



Action cut
Cut in the middle of a movement

Match cut
A similar shape bridges time and space

Jump cut
Skips time within the same framing

Figure 15 Three ways to join cuts. The red vertical line marks the edit point.

Ways to join cuts

Default
Action cut
- Cut mid-movement
- Opening a door, sitting, lifting an object — the smoothest

Memory
Match cut
- Joins two frames with similar shape · color · motion
- A strong leap across time and space

Speed
Jump cut
- Skips time within the same framing
- The basic grammar of short-form

Sound
J-cut / L-cut
- Sound comes in early: J; previous sound lingers: L
- Scenes feel connected

Contrast

Cross-cut

- Alternates two events in different places
- Tension and contrast; comparison ads

One take

Invisible cut

- Cut as something covers the frame or mid whip pan
- Completed with compositing in post-production

Gaze

Cut on look

- A look, then what is seen
- The oldest join; the basis of eyeline match

Transition effects

Transition	Notation	Feel	Good use	Common misuse
Hard cut	CUT TO	Immediate	Most joins	-
Dissolve	DIS	Time passing, softness	Flashbacks, time jumps	Overused on every cut
Fade in/out	FI / FO	Beginning and end	Opening and closing a piece	Used to open short-form
Wipe	WIPE	Playful, retro	Comedy, chapter breaks	Used in serious ads
White flash	FLASH	Shock, shift	Stressing impact	Tiring when repeated
Motion blur transition	WHIP	Speed, connection	Short-form rhythm	Mismatched direction

The most common beginner mistake

Putting a dissolve or flashy transition on every cut. A professional editor's work is mostly hard cuts; transitions appear only when they mean something.

Cut rhythm by emotion

Same running time, but cut length sets the emotion

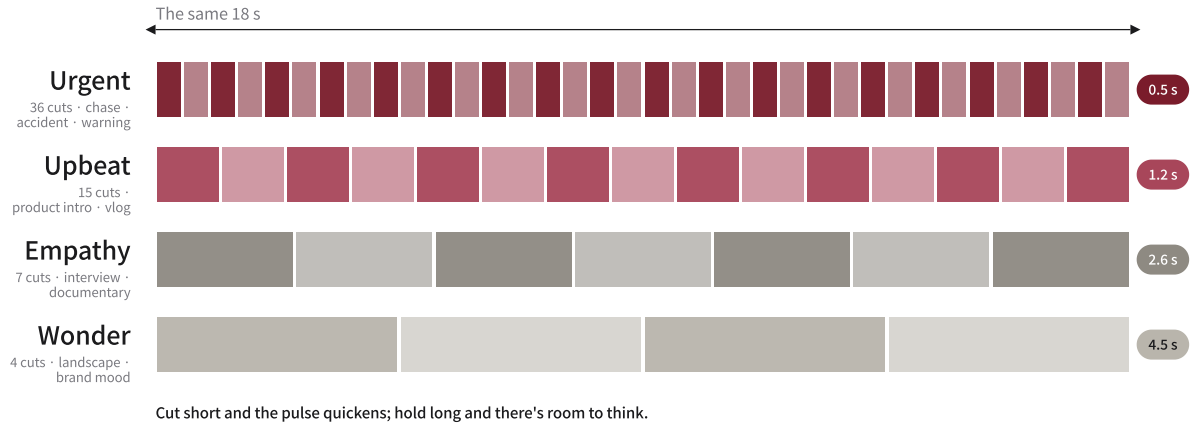


Figure 16 Cut length by emotion — in the same 18 seconds, the number of cuts sets the emotion.

Emotional tone	Average cut length	Shot size strategy	Joins	Sound
Urgency, excitement	0.4–0.8 s	Rapid shifts, mostly close-ups	Jump cuts, hard cuts	Synced hit sounds
Upbeat, fun	0.8–1.5 s	Alternating sizes	Action cuts + beat	Cutting on the beat
Warmth, empathy	2–3 s	Mostly mediums	L-cuts, dissolves	Music with long reverb
Trust, expertise	1.5–2.5 s	Steady mediums and inserts	Action cuts	Narration-led
Wonder, awe	3 s or more	Long shots, slow moves	Dissolves	Music only, no dialogue
Building curiosity	0.5 s + 3 s	Detail insert, then the whole	Hard cut, then hold	Using silence

TIP

Setting the music's beat first and fitting cut lengths to it fails least.

People learn a regular rhythm, then take notice when it breaks. Make every cut the same length and the information gets across but isn't remembered.

Exercise 1.10

Task Make a 1-minute video that uses hard cuts, match cuts, jump cuts, J · L cuts and dissolves.

Tip A match cut starts with finding two cuts that share a shape or direction of movement.

Assessment Reasons behind each transition; rhythm

Model answer The bone-to-spaceship match cut in 2001: A Space Odyssey. Design a leap in time · space at every transition.

1.11 Mise-en-scène and montage

They are not opposites but two hands. Decide first which way your video leans, and the density of your shooting plan changes completely.

Mise-en-scène — design within one cut

- What to place in the frame
- Blocking, props, color, lighting, costume, space
- Suits slow pacing and long takes
- The audience explores the frame on its own
- Dense with information; invites rewatching
- Examples: Park Chan-wook's symmetry, Wes Anderson's palettes

Montage — collision between cuts

- What to join, in what order
- Cut length, order, contrast, rhythm
- Suits fast pacing and ads
- Tightly steers perception
- Fast to inform, strong impression
- Examples: Eisenstein, most ads

15-second ads
Montage dominates

Brand films
Mise-en-scène dominates

Exercise 1.11

Task	Shoot one scene twice: a long-take mise-en-scène version and a montage version.
Tip	For the long take, design the blocking first; for montage, the order of cuts.
Assessment	Did you explain how the two differ emotionally?
Model answer	The corridor scene in Oldboy and Battleship Potemkin. Complete both versions from the same script.

PART 01 The language of video

1.12 Color and production design

Color in the frame is information, not decoration. A frame with uncontrolled color looks amateur, however good the composition.

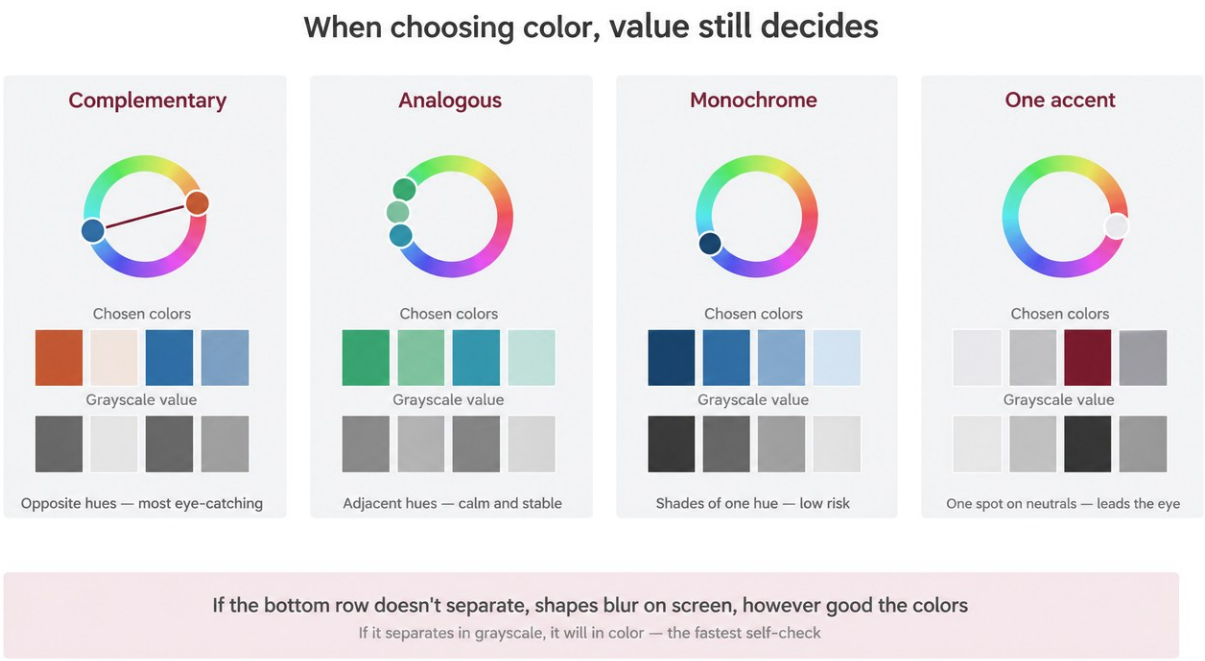

Figure 17 Value structure of four color schemes

Color	Common associations	Use in video	Note
Red	Passion, danger, appetite	Accents, brand highlights, tension	Keep to 5% of the frame or less
Orange	Warmth, energy, evening	Skin tones, sunsets, friendliness	Strong when paired with teal
Yellow	Warning, cheer, sunlight	Grabbing attention, targeting kids	Tiring over large areas
Green	Nature, calm, health	Eco, food, reassurance	Banned for costumes on chroma key shoots
Blue	Trust, coolness, technology	Finance, IT, night	Too cold feels distant
Purple	Luxury, mystery, creativity	Beauty, art, premium	Hard to reproduce
Neutrals	Restraint, sophistication, seriousness	Luxury products, black-and-white looks	Needs one accent color

Color scheme strategies

Commercial standard

Complementary contrast

- Orange and teal is the classic
- Skin is orange, so pushing the background teal separates the person instantly

Unity

Analogous harmony

- Neighboring hues only
- Calm and refined, but can go flat

Identity

Monochromatic harmony

- Only value changes, within one hue
- Suits brand-color campaigns

Product focus

A single accent color

- All low saturation; one color kept saturated
- The surest way to make a product stand out

Production design checklist

Note

If there's a brand color, always plant it in a prop. It can't be created in post-production.

- Lock in costume colors before the shoot. Decide them on set and they'll clash with the background.
- On chroma key shoots, ban outright any costume or prop in the backdrop's color family.
- Cover or replace brand logos on props that will be in frame, in advance.
- Check that wall color and the lights' color temperature don't clash. Color bouncing off a white wall tints the skin.

Exercise 1.12

Task	Dress and shoot a space that expresses one emotion (e.g., isolation) with color and props alone.
Tip	Limit it to 1 dominant, 1 secondary and 1 accent color.
Assessment	Unity of color · props · space
Model answer	Wes Anderson's palettes. Make the color chips first, then build the set to match.

PART 01 The language of video

1.13 Shot breakdown drill: taking 30 seconds apart

The fastest way to build skill is to take other people's videos apart cut by cut. Repeat the steps below on just ten pieces and you'll see differently.

01
Choose
Not what you like, but a video that fits what you want to learn

02
Sound off
See what the picture alone conveys

03
Picture off
Map the music and effects structure

04
Mark cuts
Step through in 0.5 s increments and mark every cut point

05
Tabulate
Log each cut's size, angle, move and duration

06
Classify joins
Action cut, match cut or jump cut

07
Why cut there
One line — the core of the analysis

08
Redesign
Rebuild the same structure with your own material

Patterns to read in the breakdown

Item	What it tells you	Apply to your work
Average cut length	Pacing and genre	Set lengths for the target emotion
Size distribution	What it wanted you to focus on	Adjust your share of close-ups
First 3 cuts	Hook strategy	Redesign your opening
Longest cut	The moment it valued most	Where to place the key message
Last 3 cuts	What it wants remembered	Brand exposure structure
Music entry point	Design of emotional shifts	Syncing music and cuts
When captions appear	Information strategy	Caption frequency and position

> **Keep building analysis notes**
>
> One A4 page per piece is enough; in 1 year you'll have 50. These notes later become the basis for your directing decisions, and proof of your feel for trends in job interviews.

Exercise
1.13

Task	Break down one 30-second ad shot by shot in a table (time, shot size, angle, movement, sound, captions).
Tip	Watch at 0.5x speed and pause at every cut.
Assessment	Precision of the analysis; rules discovered
Model answer	Borrow the analyzed structure as is and rebuild it as a 30-second storyboard for your own product.

PART 01 The language of video

1.14 The meaning color makes

Color is read first on screen and noticed last. Before reading a single caption, the audience has already judged whether the scene is warm or cold.

Golden backlight
Nostalgia and warmth — family · memory · holiday ads. Backlight at sunset
Reference photos 1.14A Generated images — directing reference

Orange and teal

Separates people — action, trailers, most ads. A look overused into cliché

Cold blue

Isolation — IT, finance, tense scenes. Skin goes pale

Single accent color

Forces the eye — product ads, logo cuts. Two accents and the effect is gone

Color strategy	Effect on screen	Typical use	Note
Warm daylight	Safety, memory, nostalgia, everyday	Family, food and drink, flashbacks	Overdone, a tacky yellow cast
Cold blue	Isolation, reason, technology, night	IT, finance, tense scenes	Skin goes pale
Orange-teal contrast	Separates people, commercial polish	Action, trailers, most ads	A look overused into cliché
Desaturated monochrome	Restraint, luxury, seriousness	Premium products, documentary	Easily gets dull
Single accent color	Forces the eye, imprints the brand	Product ads, logo cuts	Two accents kill the effect
Saturated primaries	Youth, play, energy	Short-form, kids, sports	Hard to reproduce in print · outdoors
Black and white	Shifts in time, essence	Flashbacks, interviews, artistic statements	Requires designed tonal contrast

TIP

Think of color as setting the direction of emotion, and saturation its intensity.

— Color is decided on set. If wall, costume and prop colors aren't settled in advance, post-production can't undo it.

— Always plant the brand color somewhere in the frame. Change color in post-production and skin tones shift with it.

- Keep one color temperature within a scene. Mixed light multiplies grading time in post-production.
- If you plan to extend into outdoor and print, allow in advance for highly saturated colors not reproducing.

Exercise 1.14

Task	Grade the same scene three ways and write down what story each one tells.
Tip	Color sets the direction of emotion; saturation, its intensity.
Assessment	How color choice links to meaning
Model answer	The green of The Matrix, the pink of The Grand Budapest Hotel. Track how color shifts across time periods within one film.

PART 01 The language of video

1.15 Point of view: whose eyes are we looking through?

The camera is always placed in someone's position. Choosing that position is point of view, and when point of view wavers, the audience falls out of the story.

Observer
Objective POV
- Eye-level medium shot by default, information kept neutral
- Most informational videos and interviews

Character's eyes
Subjective POV
- Needs a cut just before it showing the character looking
- The basis of horror and immersion

In between
Over-the-shoulder POV
- Shows the relationship, takes one side
- Standard for dialogue

An impossible vantage
Omniscient POV
- High angle, bird's-eye
- Situation as diagram; fated distance

Action cam

1st-person record POV

- The vlog's POV
- Camera shake as proof of reality

Machine's eye

Surveillance POV

- CCTV, monitors, drone feeds
- Information gap and unease

Keep the POV consistent within a film

If a subjective POV suddenly cuts into an objective one, the audience reads it as meaningful. Without meaning it is a mistake; with meaning it is a powerful device. You must be able to explain which it is.

Exercise 1.15

Task	Shoot the same event in 1st-person, observer and omniscient POV.
Tip	POV is set by camera position and the amount of information.
Assessment	Deliberate design of what the audience knows
Model answer	Hitchcock's explanation of suspense (the bomb under the table). Letting the audience know more than the characters creates tension.

1.16 Cropping

This section covers the meaning made outside the frame. In video, what is not seen is not absent; it has been cut off. What you push out of the frame matters as much as what you keep in.

Crop point	Impression on screen	Why use it	When to avoid
Top of head	Intimacy, immersion, emotion	Standard for close-ups	When an ID-photo look is needed
At a joint	Unstable, awkward	Deliberate discomfort	Avoid in most cases
Between joints	Stable	Default for people shots	-
Hands and feet	Action vanishes	To focus on the expression	Product-handling scenes
Other speaker	Isolation, one-sidedness	Psychological rift	Showing a relationship
Core of the event	Imagination, tension	Violence · budget · censorship	Ads that must prove a claim

Crop point	Impression on screen	Why use it	When to avoid
Edge of the space	Expansion, continuation	Suggests scale	When the space is the message

Note

Don't crop people at the joints. Cutting at the wrist, elbow, knee or ankle makes it feel as if the cut-off part has been left outside the frame.

— Offscreen sound builds a world beyond the frame. An unseen character's voice gives that character a larger presence.

— Cropping part of the product in a product ad is risky. If consumers can't make out its shape, they won't buy it.

— If you plan to reuse the footage vertically, shoot assuming the sides will be cut. Keep what matters on the central vertical axis.

Exercise 1.16

Task Make a 20-second scene that conveys an event through offscreen sound or eyelines alone.

Tip Decide first what you won't show.

Assessment Measured reveal that sparks imagination

Model answer The unseen shark in Jaws. Offscreen sound alone creates the fear.

PART 01 The language of video

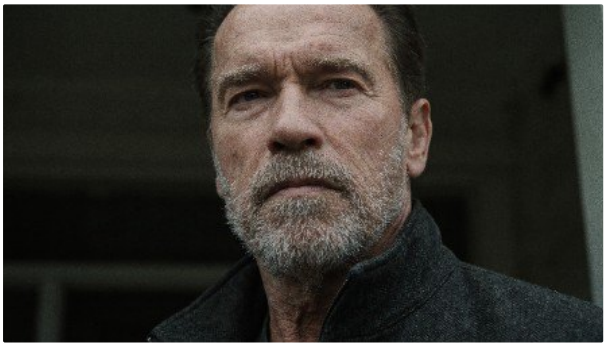
1.17 Angles on the face

A face seen from above and one seen from below belong to different people. In a close-up, even a slight change in camera height shifts the face's proportions, and those proportions are read as character. The audience takes in the shape of a face before its expression.

Dutch angle on the face

The horizon tilts — unease · intoxication · madness. A thriller signal

Reference photos 1.17A Generated image — directing reference



Low angle on the face

Chin and nostrils, authority — the forehead and crown shrink, so the face seems to tower. A villain's first entrance, speeches

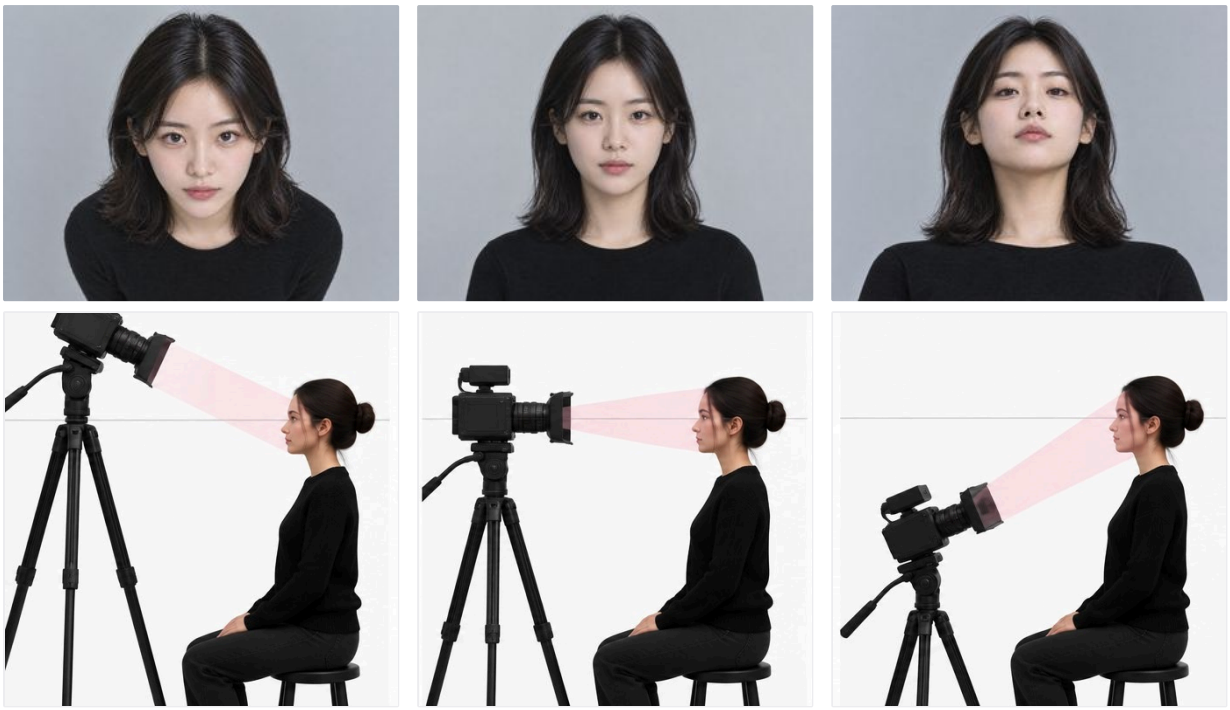
Eye level on the face

Dialogue and empathy — proportions stay intact, making audience and character equals. The interview default

High angle on the face

Larger forehead, smaller chin — a young, weak character in need of protection. The selfie angle

Camera height changes a face's proportions and impression



High angle
Forehead grows, chin shrinks — weak, in need of protection

Eye level
True proportions — neutral, the interview default

Low angle
Chin and nostrils show — authority, threat

Figure 18 Camera height alone changes the same person's character. Interviews default to eye level.

Rules on set

- Measure camera height against the subject's eyes. A lens just a hand-span below the eyes is already a low angle.
- The wider the lens, the stronger the angle effect. A 24mm low angle becomes exaggeration; an 85mm low angle becomes restrained authority.
- Changing a character's angle within a scene marks a shift in power. Start with a high angle, say, then move to a low angle once they have made up their mind.

TIP

A face's angle is read before its expression. Before changing the performance, try changing the camera height.

Exercise
1.17

Task	Shoot close-ups of the same person at eye level ±30cm and compare how the impression changes.
Tip	Shoot again with 24mm and 85mm lenses to see how much the angle effect differs.
Assessment	Camera heights logged, proportion changes observed
Model answer	Gradually shifts the face angle within a scene to follow the character's psychological change.

PART 01 The language of video

1.18 Eyeline direction: meeting and following

The audience looks where the person on screen looks. A gaze is the strongest directional line in a composition, and in editing it is the thread that ties one cut to the next.

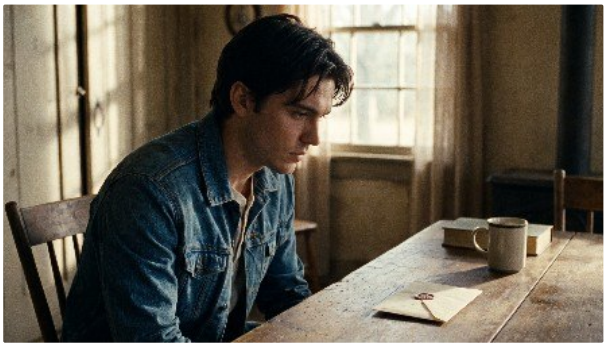
Difference in eye height

Looking down and looking up — eyeline height states the power relationship

Reference photos 1.18A Generated image — directing reference

Meeting gazes

The axis of a relationship — if A looks right, B must look left for them to read as facing each other



Following the gaze to an object

Eyeline match — when a character looks offscreen, the audience expects to see the object in the next cut

Brightness and sharpness lead the eye

Brightness, sharpness, movement, faces, in that order — place these where the character is looking

The gaze is the strongest thread between cuts

Meeting — two gazes meet on one line

A — looks screen right

B — looks screen left

Following — the gaze calls up the next cut

① Look
The gaze leaves the frame

② What is seen
Audience sees it too

③ Reaction
Meaning is complete

Figure 19 Two uses of the gaze — the eyeline match of meeting gazes and the gaze link of following (the Kuleshov effect). Looker · what is seen · reaction is the most-used set in film grammar.

■ Five kinds of gaze

Reference photos 1.18B Generated image — five kinds of gaze

Meeting

The audience reads the tension between two people — close means intimacy, far means conflict. Confessions, negotiations, showdowns

Camera gaze

The 4th wall breaks and the audience feels called on. Ad CTAs, interviews, vlog greetings, news anchors

Offscreen gaze

The audience wonders 'What are they looking at?' — leave look room on the gaze side and let the next cut answer. Waiting, memories, the moment before a discovery

Back view

The audience becomes the character's eyes — the face is hidden, but we share the world they see. Back views in travel videos, departures, moments of resolve

Shared gaze

The audience reads the two as allies and wonders what their gazes converge on. Teamwork, explanations, product demos, families watching together

Gaze type	Look room rule	Expected next cut
Meeting	Space toward the other person; opposite directions in the two cuts	The other's face (reverse shot)
Camera gaze	Even sides, eyes on upper third	Expectation closes — caption, product, next scene
Offscreen gaze	Wide space on the gaze side	The object of the gaze (eyeline match)

Gaze type	Look room rule	Expected next cut
Back view	Leave space open in the direction they look	The view they see, or the face turning back
Shared gaze	Space where the two gazes converge	What the two are looking at

Link

The eyeline match is the promise that the next cut shows where the gaze points. The 180-degree rule in 1.8 is what keeps that direction, and the three checks in 1.8 apply unchanged to these five gazes.

Meeting: put both gazes on one line

- If A looks screen right, B looks left. The line of the 180-degree rule is the line joining the two gazes
- Match eye height and gaze angle across the two cuts. If only one is close to the lens, it reads as a monologue
- A two-shot facing each other means conflict or intimacy; a two-shot looking the same way means companionship and empathy

Following: the gaze calls up the next cut

- Look, what is seen, reaction: three cuts, the most basic gaze link
- The Kuleshov effect — the same blank face changes meaning with the next cut. Editing, more than acting, gives a reaction cut its meaning
- Put brightness · sharpness · movement · faces where the gaze points, and the audience's eyes follow

> Leave space on the side the gaze points to, and put the next cut where it lands.
>
> 1.18 Eyeline direction

Exercise
1.18

Task	Shoot a face-to-face conversation between two people that holds the eyeline match, then join 3 following cuts in which the gaze calls up the next cut.
Tip	If the other actor isn't there, stick an eyeline mark beside the camera.
Assessment	Eye height and direction match; following cuts link
Model answer	Conveys emotion without dialogue in just 3 cuts: gaze → insert → reaction.

PART 01 The language of video

1.19 Principles of visual form

This is about proportion · balance · rhythm. If composition is a question of where to place things, the principles of form are a question of how to relate them. Read with the composition plates in 1.6.

Term

The rule of thirds (1 : 2) is an approximation that simplifies the golden ratio (about 1 : 1.618) for easy use on set.

Six principles

Size relation
Proportion
- Size of part relative to whole
- e.g. rule of thirds, golden ratio

Weight
Balance
- Visual weight evened out left and right
- Symmetry is order and ritual; asymmetry is naturalness and tension

Axis
Symmetry
- Both sides alike about a central axis
- Frontal symmetry and 1-point corridors: auteur signatures

Repetition
Rhythm
- Repeated shapes or intervals
- The eye stops the moment one breaks

Difference
Contrast
- Size, tone, color, direction
- Bigger gap, clearer subject

Focus
Emphasis
- Focuses the above on one point
- One emphasis per frame

What changes in video

— Rhythm in video exists on two layers: repetition within the frame and repetition of cuts. Cuts of equal length become a pattern; a sudden shortening becomes tension.

— Movement keeps shifting the balance. A person walking in can complete an asymmetric frame into symmetry.

Related artists and theory

- **Rudolf Arnheim** Art and Visual Perception (1954) — the classic that explains forces and balance in the picture through the psychology of perception
- **Wassily Kandinsky** Point and Line to Plane (1926) — the Bauhaus textbook that systematized the elements of form. Revisited in 6.14
- **Henri Cartier-Bresson** — set the standard for photographic composition with the decisive moment and geometric framing
- **Yasujiro Ozu, Wes Anderson** — directors who built their own visual grammar from low fixed cameras, frontality and strict symmetry

> A good frame is not one with many elements but one with clear relationships.
>
> 1.19 Principles of visual form

Exercise
1.19

Task	Make 3 stills applying proportion · balance · rhythm in turn, plus 1 video of 10 seconds.
Tip	Rhythm shows best when you vary the spacing of repeated elements.
Assessment	Accurate use of the principles; intent where they are broken
Model answer	Places one exception within a repetition to draw the eye.

PART 01 The language of video

1.20 Time and space in video

A cut moves time and place. Where painting and photography hold one place at one moment, video cuts time and space apart and joins them again. Editing is designing these moves so the audience accepts them naturally.

A cut breaks time and space and rejoins them — video is the editing of moving time and space

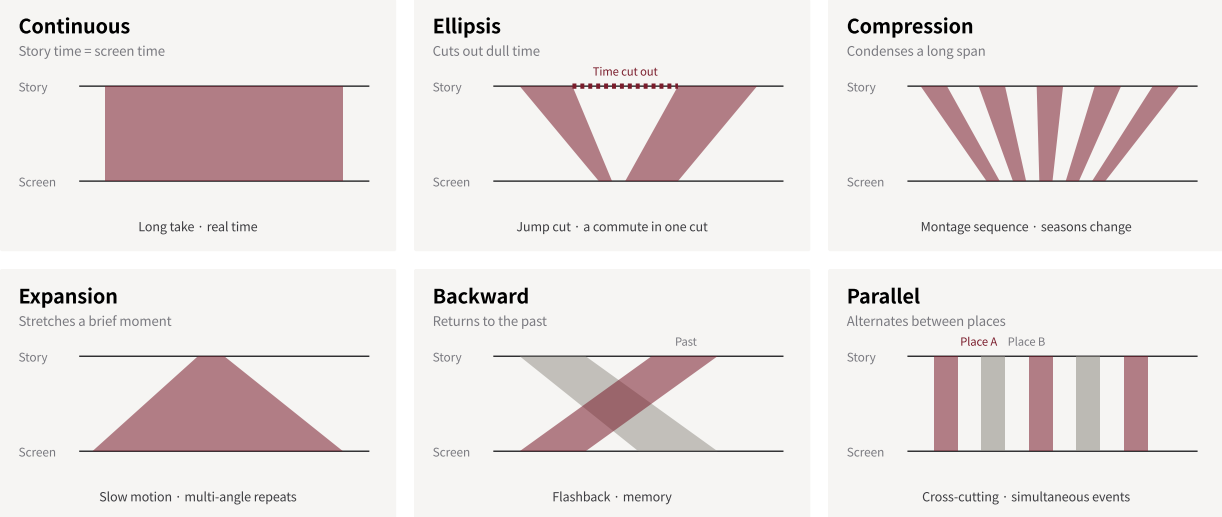


Figure 20 Story time and screen time — six moves through time and space. The upper line is story time; the lower line is screen time.

Six ways to handle time

Equal
Continuous
- Story time = screen time
- Long takes, real-time structure

Default
Ellipsis
- Cuts out unneeded time
- The default of all editing

Gather
Compression
- A long span as a run of short cuts
- Montage sequence

Stretch
Expansion
- A brief moment, drawn out
- Slow motion, one moment from many angles

Go back
Backward
- Flashbacks and recollection
- A character's memory as structure

At once
Parallel
- Different places, same time, alternating
- Cross-cutting — the oldest device for building tension

Ways to join space

— The 180-degree rule and the eyeline match bind separately shot cuts into one space.

— A match cut joins entirely different places through similar shapes. If the shape matches, the audience accepts the leap.

Term

Creative geography — Kuleshov's experiment. Cuts shot in different places

read as one place once joined.

— When the camera moves within a cut, space changes without editing. A long-take tracking shot makes the audience walk through that space too.

Related theory

— **Eadweard Muybridge, Étienne-Jules Marey** — broke motion into units of time with sequential photographs. Where the idea of the moving image begins

— **Sergei Eisenstein** — montage theory: two colliding cuts create a new meaning

— **André Bazin** — held that long takes and deep depth of field preserve real time and space better than editing

— **Gilles Deleuze** Cinema 1: The Movement-Image (1983), Cinema 2: The Time-Image (1985) — thinks film through images of movement and images of time

> Before joining two cuts, decide how much time and distance passes between them.
>
> 1.20 Time and space in video

Exercise
1.20

Task	Show '1 year has passed' in just three cuts. No captions.
Tip	Use at least two of these: changes in season, light, props or people.
Assessment	Passage of time reads without explanation
Model answer	Repeats one composition and lets only one thing change, so time is felt.

PART 01 wrap-up

Exercises and review

01 **8-shot comparison chart**

Shoot one person in the 8 sizes ELS, LS, FS, NS, MS, BS, CU, ECU in the same place, changing only the size, and lay them out on one chart.

02 **Dialogue scene coverage**

Shoot and edit a short conversation between two friends as 1 master, 2 OSS, 2 reaction and 1 insert cut. Check that the 180-degree rule holds.

03 Angle and perceived price

Shoot the same product at eye level and from a low angle, and ask five people which looks more expensive.

04 Find the match cut

Find a match cut in an ad you like and note which element forms the link.

One-page summary

1.1 Units of video	Don't mix up scene and cut in storyboard meetings. Notation like S#12 C#04 T3 keeps the schedule precise.
1.2 The 8 shots	Shot size is set not by how big the person is but by where the frame cuts.
1.2 · 1.8 Size and angle	Between two consecutive cuts, change the size by two steps or more and the angle by 30 degrees or more.
1.4 Shots by situation	In every scene, always get 1 master shot and at least 2 inserts.
1.6 Negative space	Space has names. If headroom, nose room or lead room is off, the frame feels wrong for no clear reason. Secure space for captions and logos before shooting.
1.7 Guiding the eye	The audience's eye is drawn to brightness, movement, sharpness and faces. Directing is controlling that order.
1.9 Camera movement	Use only one move per cut. Explain the difference between a dolly and a zoom through perspective.
1.10 Cuts and transitions	Professional editors' work is mostly hard cuts. Polish comes from the order of the cuts, not the number of effects.
1.12 · 1.14 Color	Decide color on set. Plant the brand color in a single prop; don't create it in post.

1.18 · 1.20 Gaze, time and space	Put the next cut where the gaze lands, and decide first how much time and distance lies between two cuts.

Questions to consider

Q Which shot sizes do I use most? Is that habit or choice?

Using the 8-shot chart, mark the size you shot most and the one you never shot.

Q What is the most memorable cut in something you watched recently, and why did it stay with you?

Break it down by size, angle and length.

Q How do you voice framing notes on set?

Use industry terms like 'a bit tighter' — 'make it a little smaller' gets three readings from three people.

MEMO · PART 01

PART 02

What you make in this PART

1. A one-sentence concept
2. A 6-cut storyboard and animatic
3. A 12-item PPM document

Planning and pre-production

If you're still deciding on set, you're already late. Professional sets are quiet because the decisions are already settled on paper. This PART starts from the question "What will people find fun?" and follows the path from a one-sentence concept to the storyboard and PPM.

PART 02

Introduction

If you're still deciding on set, you're already late. A set burns hundreds of thousands of won an hour, and ten people wait on one person's decision. That is why professional sets are quiet: the decisions are already settled on paper.

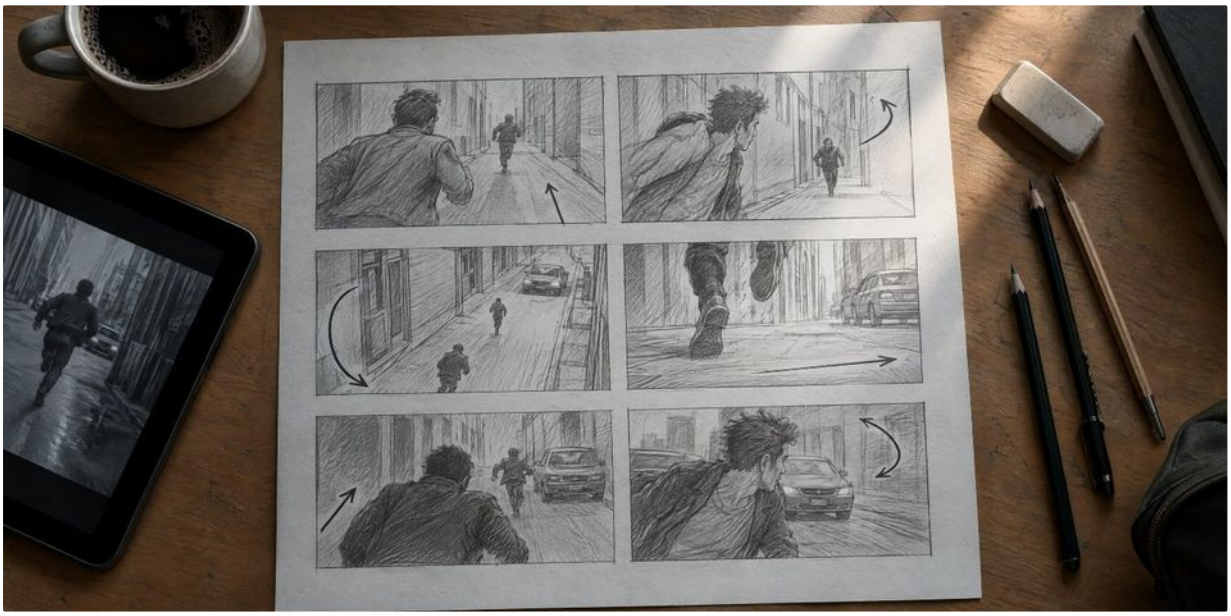
Planning documents are not paperwork; they are a promise that no one will have to ask again on set. A storyboard is a device that makes ten people imagine the same frame, and the PPM is the procedure that locks every decision at the last moment when change is still cheap. In student projects too, gaps in understanding among team members must surface before the shoot day, not on it.

What I most want to stress is the one-sentence concept: this ad makes whom feel what, and in what way. If that sentence doesn't come, don't draw the storyboard. A plan that starts with pictures always collapses midway. Once the sentence is locked, everything follows from it: which cuts to drop, which music to choose, how many captions to use.

Feature · STORYBOARD

2.1 The storyboard, a promise made in pictures

A storyboard is a matter of information design, not drawing skill. This feature sets out in one place what a panel must say for ten people to shoot the same scene, and how the panel changes across media: horizontal · vertical · ultra-wide · 360 · curved · facade · AR/VR/MR/XR.



G-18 Storyboarding — write shot · movement · time in every panel. The drawing can be rough; the information cannot.

01
Continuity

The director sorting out ideas. Rough drawings, several versions compared, for internal meetings. 1–2 hours.

02
Storyboard

The blueprint for the whole crew. Exact framing · timing · sound. Minimal changes after PPM approval. 1–2 days.

03
Animatic

The boards on a timeline with temp music · narration. Rhythm and length problems show at once. 2–3 days.

TIP

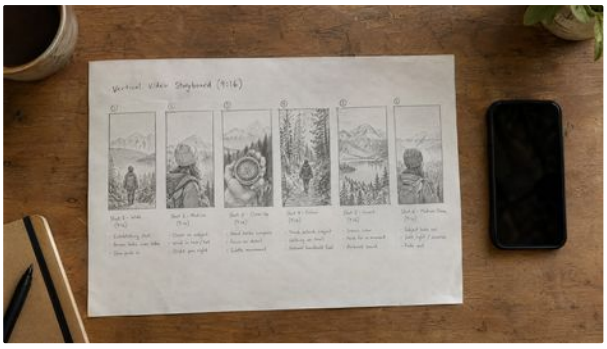
For a 15-second ad or a 1-minute short-form piece, go all the way to an animatic. Rhythm problems do not show in still pictures.

The storyboard is the last point in the production pipeline where mistakes are cheap to fix. If a change at the concept stage costs 1, it costs 3 at the board stage, 20 on shoot day, and 50 in post. So a board is not a document for drawing nicely but **a document for getting it wrong fast.**

Reference photos 1.1A Generated image — four faces of the storyboard

Note

Hand-drawn storyboard — panels · arrows · timing notes on one sheet



Note

Vertical video storyboard — panels get narrow and tall

Note

Digital storyboard — drawn on a tablet, straight into an animatic

Note

Animatic — put the boards on a timeline to test the rhythm

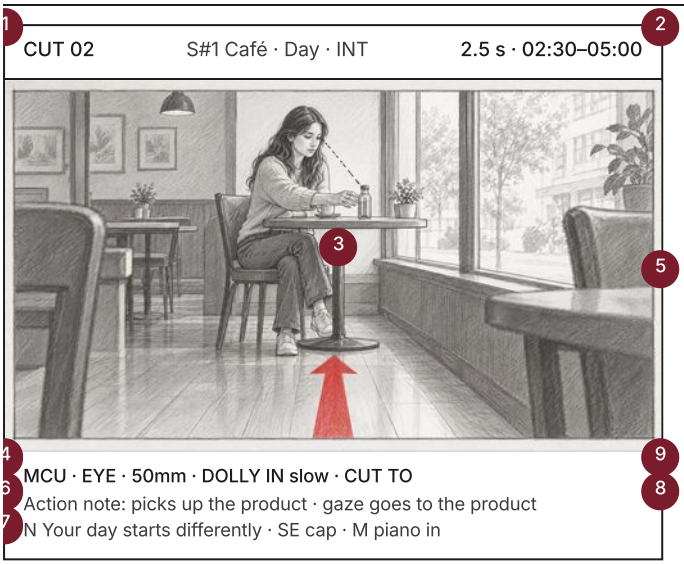
c Location scouting

SPREAD 01

Anatomy of a panel — all nine items, or no one else can shoot it

Anatomy of a panel — nine items



1	**Cut number · scene**	Basis for order and reference
2	**Time**	Duration in seconds + running time code
3	**Picture (frame)**	Composition · position · gaze · arrows
4	**Shot size · angle · lens**	ELS–ECU · EYE/HIGH/LOW
5	**Camera movement**	Direction + one word for speed
6	**Action note**	The event, as a verb
7	**Narration · dialogue**	N / V.O. / SYNC
8	**Sound**	M · SE · ATM
9	**Transition**	CUT / DIS / FI / FO

Figure 21 Elements of a storyboard panel. Only when all nine are written can someone else shoot the same picture.

Inside the panel

Only what is seen

- Position and size of people · objects (shot size is drawing size)
- Gaze direction, movement arrows (subject = black, camera = wine)
- Caption · logo areas entering the frame as dotted boxes
- Safe-area dotted line — captions only inside it

Outside the panel

What is heard, and measurements

- Time: both duration in seconds and running time code
- Abbreviations: SIZE / ANGLE / LENS / MOVE / TR
- Action notes as verbs, emotions as adjectives, kept apart
- N · V.O. · SYNC · M · SE — four layers of sound on one line

SPREAD 02

Panel templates by aspect ratio — change the ratio and the grammar of composition changes

Always draw storyboard panels **in the exact delivery ratio**. A board drawn in 16:9 and then cropped to vertical is not a board. Each template below re-stages the same scene (person · product · background) for its ratio. The dotted lines are action safe (90%) and title safe (80%).

Panel templates by aspect ratio

4:3
1440×1080 · retro

16:9
1920×1080 · standard

21:9
3840×1608 · cinema

1:1
1080×1080 · feed

4:5
1080×1350 · feed max

9:16
1080×1920 · short-form

9:21
1080×2520 · vertical LED

2:1 equirectangular
4096×2048 · 360/VR — red frame is the front 90°

Plate SB-1 One scene, nine ratios. Change the ratio and the subject's size and the background's share change — draw the board in the exact delivery ratio.

Ratio	Typical resolution	Where	Composition rule in one line	Watch out when drawing
16:9	1920×1080 · 3840×2160	YouTube, TV, monitors, presentations	Eyes and product on the 3rds lines	Shoot 4K → room to extract vertical
21:9 (2.39)	2048×858 · 3840×1608	Cinema, brand films	Horizontal empty space is emotion; two people in one cut	Delivered letterboxed in 16:9; check caption position
9:16	1080×1920	Reels · Shorts · TikTok	Middle 60%, face in the upper 1/3	UI covers top 14% · bottom 25%
9:21 (1:2.33)	1080×2520	Vertical LED, elevators · pillars	Top→bottom flow, vertical center line	Viewing distance 2m+ → text at least 60px
1:1 · 4:5	1080×1080 · 1080×1350	Feed ads	Centered, even margins	16:9 source loses 44% at the sides
2:1 (360)	4096×2048 · 7680×3840	VR headsets, 360 players	Action within the front 90°, sound behind	Zenith · nadir distortion, paint out the tripod
Free ratio	LED module count × pixel pitch	Curved · facade · dome	The 'viewing position' is the reference, not the surface	Unwrapped view + top view, two sheets together

SPREAD 03

Horizontal and vertical are not different media but different languages — design the same cut twice

Design the same cut twice

× Vertical center-cropped from 16:9

Half a person, half a window — cropping is not design

○ Cut redesigned for vertical

Face in the upper 1/3, product centered, less background

Moving to vertical

- Shots one size tighter
- Background goes in a separate cut
- Gaze and movement run top to bottom
- Captions inside the middle 60% band
- Cut count rises 20–30%

Plate SB-2 Horizontal and vertical are different languages. The difference between a center crop (left) and a redesign (center).

■ Vertical board sample — 15-second short-form ad (9:16, 6 cuts)

Vertical board sample

01 0–1.5 — CU · LOCKED — Yawn · caption "Every morning, this?"

02 1.5–3.5 — ECU · HIGH · push in — Hand picks up the bottle · SE cap

03 3.5–6 — MCU · HH — A sip, eyes open · "Oh."

04 6–8 — LS · LOW · TILT UP — City outside the window · N Before the city

05 8–10 — 2S · LOCKED — Bottles clink · SYNC laugh

06 10–15 — MS · push in — Product centered · logo CG · N Today, too

Plate SB-9 Vertical board sample — 15-second short-form ad (9:16, 6 cuts). Vertical panels are narrow: one line of action note, one word of sound.

A vertical board still reads with up to 6 panels per row. Vertical panels are narrow, so information runs long beneath them; write **one line of action note, one word of sound**. Draw captions only in the middle band, clear of the UI areas (gray).

SPREAD 04

360 · VR boards — design an 'axis of attention,' not a timeline

A board for flat video records "what is seen in this cut." A 360 board records **where the audience will be looking** and **what will make them turn**. The panel is a 2:1 equirectangular unwrap, always drawn with a top view above it.

360 · VR board — designing the axis of attention

01 0–8 s · front fixed

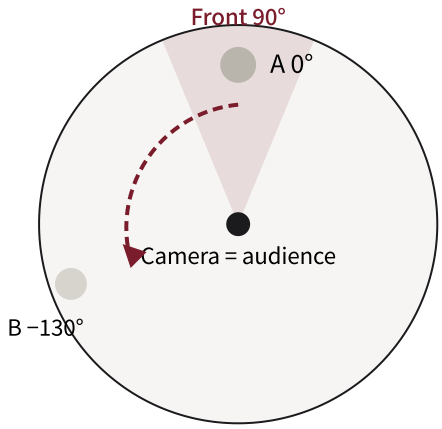
A's monologue; the viewer learns the space

02 8–14 s · sound calls

Door sound, back left → A turns → the audience turns too

03 14–22 s · new front

−130° becomes the new front. B enters

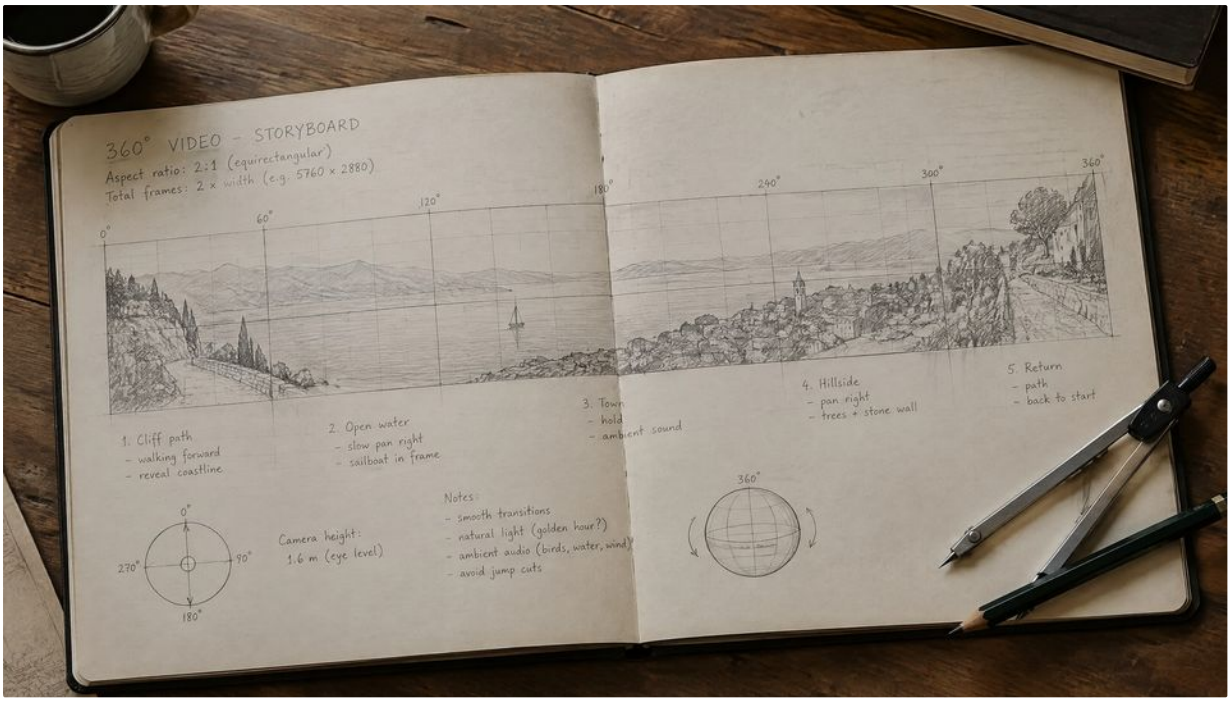


Top view

Mark where events happen as angles. If the turning in one scene adds up to more than 180°, motion sickness.

In every panel: expected front angle · attention cues (sound · light · gaze) · turn time (2 s+ per 90°)

Plate SB-3 360 · VR board — three unwrapped panels and one top view. Events behind the viewer are cued by sound, not picture.



Note 360 board sketch — mark angles and sound positions on the unwrap

360 video

The audience turns around

- Camera locked, eye height 1.2–1.6m
- Long cuts (8 s+), fade transitions
- Near subjects at least 1.5m away — stereo distortion

VR (headset)

The audience stands in the scene

- FOV 90–110°; 2–5m in front of the eyes is the main stage
- No head-locked UI · captions; attach them to the world
- Motion-sickness rule: no camera moves, or constant-speed straight lines only

Board deliverables

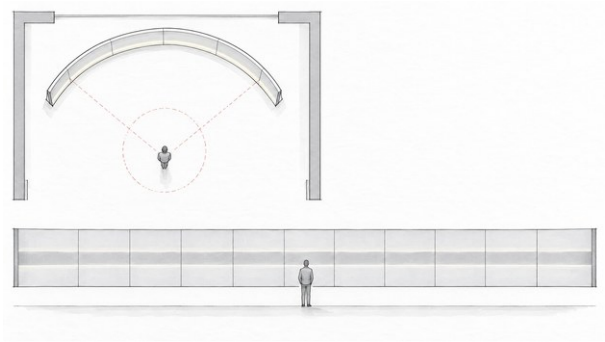
A set of three sheets

- Equirectangular unwrap (panels)
- Top view (angles · movement)
- Attention timeline (seconds × front-angle graph)

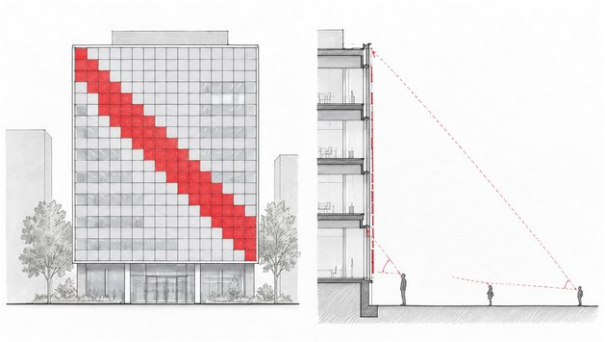
SPREAD 05

Curved LED · dome · media facade — draw 'where people watch,' not 'the screen'

Curved LED · media facade — draw the viewing position



Curved · cylindrical LED — floor plan + unwrap
First set the distortion-free radius from the viewing point · text and faces only in the eye-line band (1.4–1.8 m above the floor) · never put text on a seam · horizontal movement at 15° per second or less



Media facade — elevation pixel map + viewing distance
Minimum viewing distance (m) ≈ pixel pitch (mm) · text height is 1/250 of distance → effectively no text, only shape and color · simulate at three points: walking 20 m / across the street 60 m / far view 150 m

Plate SB-4 Boards for curved LED and media facades. The first panel is not "the screen" but "where the audience watches from, and for how long."

Medium	Panel shape	Draw alongside	Time unit	Never do
Curved · cylindrical LED	Unwrap (arc length : height)	Floor plan + viewing point + eye-line band	Scenes 20–40 s	Text on seams, horizontal moves over 15° per second
Dome (fulldome)	Fisheye circle (dome master 4096×4096)	Section + seat tilt	Scenes 30 s+	Action below the horizon, fast rotation
Media facade	Elevation pixel map	Simulate at three viewing distances	Loop 8–30 s	Body text, 100% white full screen
Projection mapping	UV mask over a building photo	Projector position · throw distance · overlap zones	Scenes 15–60 s	Relying on black backgrounds (ignoring surface texture)
Anamorphic outdoor	Two corner faces unwrapped + 1 viewing point	Mark the 'right spot'; simulate other positions	15–30 s	Content that needs explaining away from the right spot

SPREAD 06

AR · MR · XR boards — the panel splits into 'layers'

An AR · MR panel is not one flat drawing; it breaks down into **reality layer / tracked surface / virtual object layer / UI layer**. And "what the audience must do to reach the next panel (interaction)" replaces the transition mark. An XR stage (LED-wall virtual production) works the other way: the board splits into four tracks of camera · LED background · physical set · lighting.

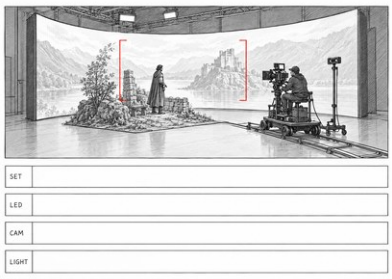
AR · MR · XR boards

AR — the panel splits into layers

Draw four layers separately: reality / tracked surface / virtual object / UI · instead of transition marks, "what must happen to reach the next panel" (tap · rotate · approach) · one failure-branch panel is a must

MR — draw on a map of the room

Virtual objects attach to wall · floor · table anchors · real furniture must occlude virtual objects for them to be believed · movement radius 2 m; never lead users outside the guardian



XR stage — a four-track board

Physical set · actors / LED background (Unreal) / camera tracking / lighting sync as four lines per cut · note inner/outer frustum, plate version, wall brightness

Plate SB-5 AR in layers, MR on a room map, XR in tracks — change the medium and the definition of "one panel" changes. What they share: first draw where the audience (or camera) is.

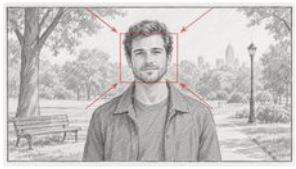
SPREAD 07

Camera language drawn inside the panel — a symbol set for shot · angle · movement · composition

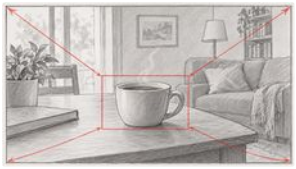
Camera language inside the panel — 8 movement symbols

PAN
Left-right double arrow

TILT
Vertical arrow



ZOOM IN
Four arrows converging inward



ZOOM OUT
Four arrows spreading outward

DOLLY IN
Arrow moving in along the floor

TRACK
Long arrow parallel to the subject

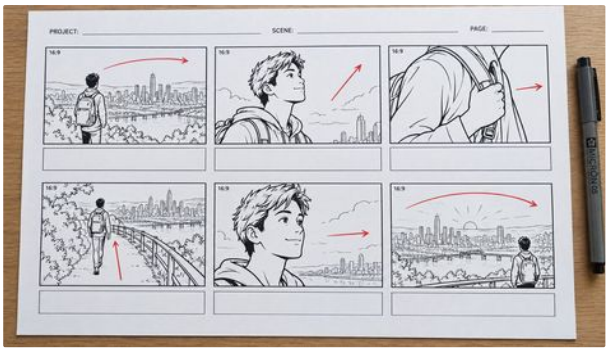
CRANE
Large arrow curving upward

HANDHELD
Zigzag at the corners

Plate SB-6 How to draw camera movement on a board — subject movement in black, the camera alone in red. Keep the symbols in a legend in the first panel.

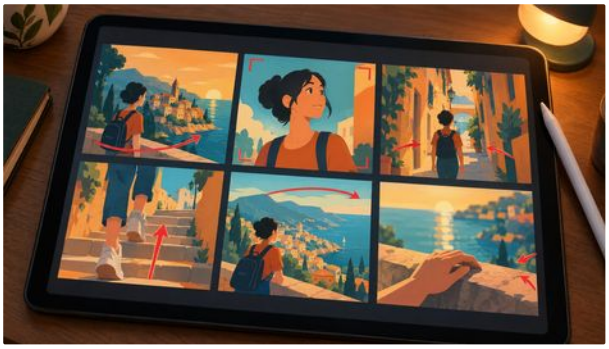
Four storyboard styles

Thumbnail — drawing to think
One panel in 10 seconds, for the director's eyes only. Good because it is easy to throw away



Clean line — drawing for the set
Clear information. The standard for ad · PPM submissions

Tone board — drawing the light
Three values of shading, down to light direction. Feature films · brand films



Color comp — just before the animatic
Tests color and rhythm together. Motion graphics · animation

Plate SB-6′ Four storyboard styles. Purpose sets the precision — a drawing for yourself is not a drawing for ten people.

SPREAD 08

Making narration and sound 'visible' — the 3-lane board and a finished 15-second ad

Sound is the information most often missing from a board. Written as one line under the picture, its length is invisible. Lay **picture lane / voice lane / sound lane** side by side on a timeline, and you can see, as if with a ruler, whether the narration runs longer than the cut and whether music changes land on the cuts.

Making narration and sound visible — the 3-lane board

	01 0–2.5	02 2.5–4.5	03 4.5–7	04 7–9.5	05 9.5–11.5	06 11.5–15
PICTURE	ECU · droplets	MCU · picks up bottle	CU · a sip	LS · city morning	ECU · on the table	MS · logo CG
VOICE		N Your day starts differently	SYNC "Mm."	N Before the city wakes		N Today too, Brand Name
MUSIC	MUTE	♪ piano in			beat	end sting · fade
SE	droplets	cap		ATM city		whoosh
CAP		start of day				SUPER · TAG

Plate SB-7 A three-lane board for a 15-second ad in 6 cuts. Panel width is time — if the narration runs longer than the panel, cut it right there. Align music changes with cut boundaries.

3 chars/s — Korean narration pace

35–45 chars — Cap for a whole 15-second ad

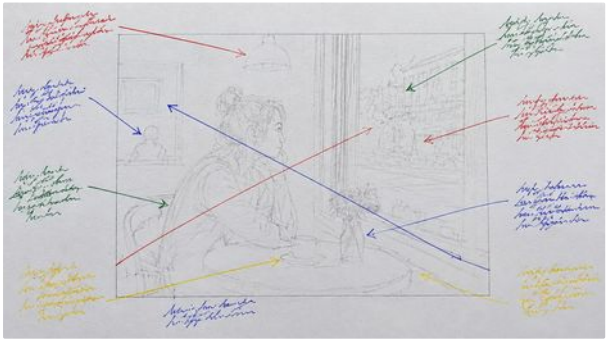
150–180 chars — Cap for a 1-minute video

0.5 s — From cut start to first syllable

SPREAD 09

Drawing for legibility — the set is dark and the reader is busy

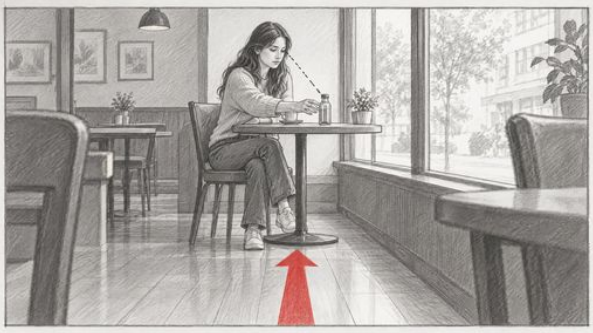
Drawing for legibility



× An unreadable panel

Thin gray lines · four arrow colors · tiny text · no numbers

CUT 02 S#1 Cafe · Day · INT 2.5 s · 02:30–05:00



MCU · EYE · 50mm · DOLLY IN slow · CUT TO

Action: picks up the product · eyes on the product

N Your day starts differently · SE cap · M piano in

○ A panel readable from 3 m

Three tones · one arrow color · big number and time · text in two lines below the panel

Plate SB-8 Same information, different legibility. A board is not for a monitor; it is pinned to a set wall and read from 3 m away.

01 **Draw in three tones.** Background (light), midground (medium), people/product (dark). Three values show form; five make a picture — a board is not a picture.

02 **Only two line weights.** Thick for outlines, thin for detail. If every line is the same weight, nothing comes forward.

03 **One color for arrows; black for character movement.** Camera moves in one color, wine (or red). Past three colors, people start hunting for the legend.

04 **Cut number and duration are the largest text in the panel.** The words shouted most on set are "which cut, how many seconds."

05 **No text inside the drawing.** Mark captions and logos with a dotted box only. All text goes below the panel.

06 **Two lines of info below the panel.** Line one: measurements (SIZE · ANGLE · LENS · MOVE). Line two: words and sound (N · SYNC · M · SE). Nobody reads a third line.

07 **Text at least 11pt (on A4), 1/40 of panel width.** Draw assuming it will be blown up to A3 and pinned.

08 **Figure size in frame = shot size.** If the figure size changes between panels labeled MS, the board is lying. Make a silhouette ruler and use it.

09 **3–6 panels per row, left→right, top→bottom.** Zigzag or vertical layouts always get read out of order on set.

10 **The legend takes the first panel.** Aspect ratio, resolution, symbol key, version and date go in panel one. The moment two board versions circulate, the shoot is lost.

Good acting directions

- Separate action (verbs) from emotion (adjectives)
- Write the behavior, not the result
- Always state eyeline direction
- e.g. Lift the product and shift eyes to camera
- e.g. One breath in, then raise only the corners of the mouth

Bad acting directions

- Look happy (no clear criterion)
- Be natural (the most irresponsible direction)
- Don't be nervous (negative direction)
- More feeling (nobody knows what that means)
- Just do your thing (abdicating direction)

SPREAD 10

All notation symbols — a table to copy as your legend

Shot size

ELS · LS · FS · KS · MS · MCU · BS · CU · ECU

- Extreme Long / Long / Full / Knee / Medium
- Medium Close-Up / Bust / Close-Up / Extreme Close-Up
- Head count: 1S · 2S · 3S · GS (group)
- Situation: OSS (over shoulder) · POV (point of view) · INS (in-sert) · CA (cutaway)

Angle · viewpoint

EYE · HA · LA · BEV · WEV · DUTCH

- Eye level / High / Low Angle
- Bird's Eye View / Worm's Eye View
- Dutch (tilt) — give the angle too: DUTCH 15°
- Lens: focal length in mm, or W (wide) · N (normal) · T (tele)

Category	Notation	How to read it	On set
Move	DOLLY IN (slow)	Slow push in	Slider, 2m in 5 seconds
Move	PAN R 90	Pan right 90 degrees	Head rotates; lock start and end
Move	TILT U from feet to face	Tilt up from feet to face	Constant speed, hold 0.5 s at the end
Move	TRACK L with subject	Track left alongside the subject	Gimbal, matched to the subject's pace
Move	ARC R 180	Half-circle move to the right	Centered on product, keep radius constant
Move	HH (subtle) · LOCKED	Subtle handheld · fully locked	Breathing-level shake · tripod, reference cut for compositing
Transition	CUT TO · DIS · FI · FO	Hard cut · dissolve · fade in/out	Instant change · soft change (length in seconds)
Transition	WIPE · MATCH · J/L CUT	Wipe · match cut · sound first/last	Shape-linked transition · mark audio lead/lag
Post	INS · CG · VFX · SFX	Insert · graphics · VFX · SFX	Log tracking markers and light direction separately on set
Words	N · V.O. · O.S. · SYNC	Narration · inner voice · off-screen dialogue · on-screen dialogue	N: Every morning, a different start. / SYNC Minseo: That's really nice.
Text	CAP · SUPER · TAG	Captions · supers · closing brand line	CAP: Try it today / TAG: Today too, Brand Name
Sound	M · SE · ATM · MUTE	Music · SFX · ambience · silence	M in/out points, dB notes

NOTE

Korean narration runs about 3 characters per second. The caps: 35–45 characters for a whole 15-second ad, 150–180 for a 1-minute video.

Do not make captions and narration identical. Captions carry key words only; narration is written in sentences. Design for muted viewing and keep captions inside the safe area. Symbols must be uniform within the team, with the legend in the first panel.

Exercise 2.1

Task	Storyboard a 30-second video in 8 or more panels, in two versions: 16:9 and 9:16.
Tip	Shot size, direction and movement arrows matter more than drawing skill. A vertical board normally needs more cuts.
Assessment	Flow between panels, camera notation, composition differences between the two ratios
Model answer	Photograph the board, string the panels into an animatic and verify the timing.

Exercise 2.1

Task	Build a template with all nine elements of a panel (number · time · picture · size/angle · move · action note · dialogue · sound · transition) filled in, then design one extra panel for a 360 or AR version.
Tip	Set text size and panel layout for the person who will read it on set. Give the 360 panel a viewpoint diagram too.
Assessment	Completeness of information, usability on set, fit to the medium
Model answer	Test it: can a teammate read it and shoot without any explanation?

Exercise 2.1

Task	Draw one storyboard page in three lanes (picture · words · sound) using every symbol: pan, zoom, dolly, track and cut transitions.
Tip	Symbols must be uniform within the team. Put the legend in the first panel. Convert narration length at 3 characters per second to set lane widths.
Assessment	Accuracy of symbol use, alignment of sound with cut boundaries
Model answer	Clear enough that the camera moves can be reproduced from the symbols alone.

Feature · PRE-PRODUCTION MEETING

2.2 PPM, the last agreement before the shoot

PPM stands for pre-production meeting. It is both the meeting just before shooting, where client · planning · direction · production lock every decision, and the document that records it. The approved PPM document becomes the reference for any later dispute. A verbal agreement that is not recorded does not exist. This feature walks through one PPM deck, page by page.

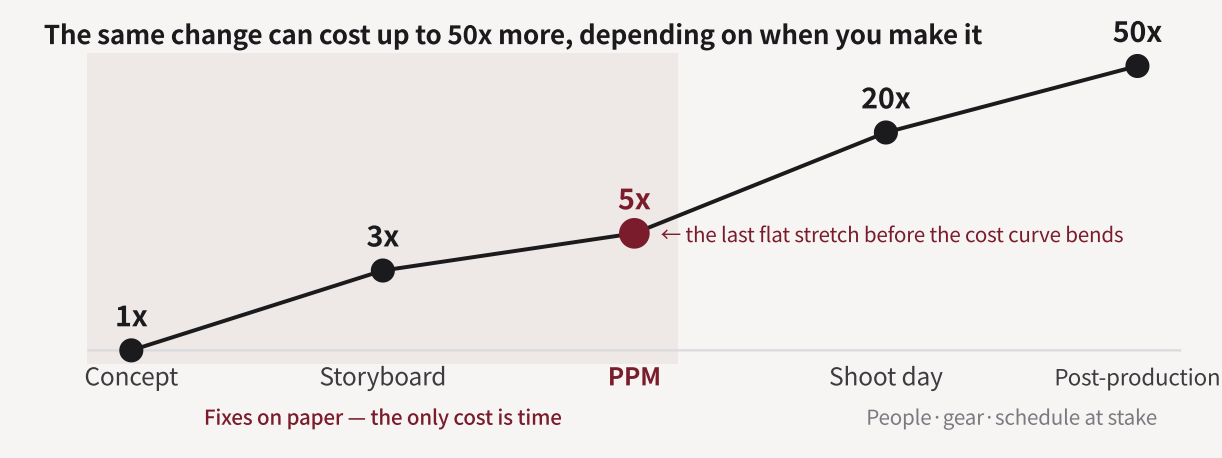


Figure 22 Cost of change by production stage — the same change can cost up to 50x more depending on when it is made. The PPM is the last flat stretch before the cost curve bends.

48 h	12 items	5 x	1 rule
Deadline for sending materials before the meeting	Required sections of a PPM deck	Cost of change at the PPM stage (concept = 1)	Exit condition — everyone can state their 'tasks for the day'

Note PPM meeting — storyboard · mood board · schedule on one table

The twelve pages of a PPM deck — page order is meeting order

#	Item	Contents	Approved by	Sample in this feature

SPREAD 01 · Directing intent

Tone and manner board — the page that turns adjectives into measurements

"Warm and sophisticated" is not an agreement. A tone and manner board translates adjectives into measurable values of **color temperature · contrast · saturation · texture · pace**, so that camera · art · post look at the same numbers. Always review references together on screen. Describe a tone in words, and everyone imagines it differently.

Tone and manner board · morning drink 15s

Light
Early side light · long shadows · 5600K

Color
Warm gray 60 · dusty blue 30 · wine 10

Texture
Linen · glass · droplets · wood grain

Movement
slow dolly only · no handheld

People
Understated expressions · gaze down→camera

× Anti-reference
Saturated short-form look — not this way

Clear
Mid-high contrast · whites not blown

Early
Single window source · long shadows

Airy
Avg. cut 2.5 sec · piano 92 BPM

Plate PPM-1

Tone and manner board — three adjectives, five references and one anti-reference, a palette. One sheet becomes the common language of camera · art · post.

TIP

Apply the palette equally to wardrobe · props · background · graphics. Send the swatch codes to the art and post teams in the same file.

In each reference panel, always write one word for "what you are referencing" (light · color · texture · movement · people). Copy a whole reference and it is plagiarism; take one element and it is study. The single anti-reference panel saves more meeting time than any other.

SPREAD 02 · Location

Location reference sheet — four photos and one floor plan

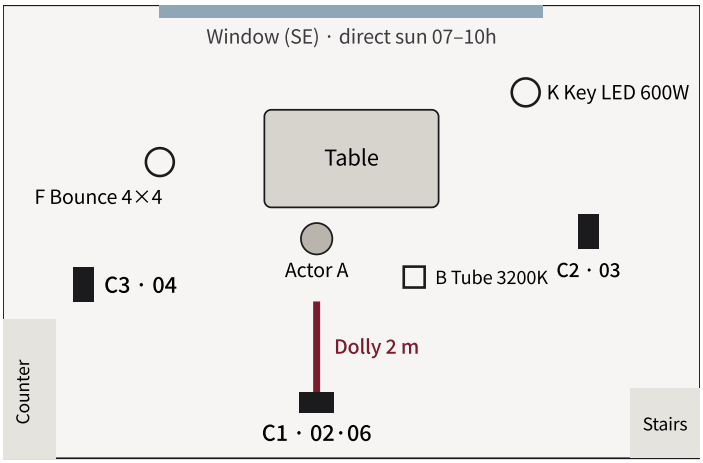
Location reference sheet · L-01 café, 2nd floor

N Window
Main set · direct sun 07–10h

E Counter
Noise source · 10-min stop during takes

S Stairs
Gear carried by 2 · no elevator

W Wall
Reverse-shot background



Measurements

Power 220V 2-outlet × 3 (3 kW) → lighting 2 kW max

Ceiling 2.9 m · window width 3.2 m · hardwood floor (dolly OK)

Noise 72 dB (machine) · parking for 2 · restroom on 1st floor

Permit: rental 07:00–10:30 · insurance ✔

Rain plan

Recreate window light with the key LED, or backup day D+2 · L-02 studio on hold

Plate PPM-2 Location sheet — photos in four directions (same time, same 24mm) and a floor plan. Put camera · lighting · dolly · power · noise sources on the plan, and setup on the day is cut in half.

Check item	L-01 café (1st choice)	L-02 studio (backup)	Deciding factor
Light	Daylight: direct 07–10h, diffuse after	Artificial light, fully controlled	Tone and manner 'early light' → L-01
Noise	Machine 72dB, 10-min stop agreed	Silent	Only 1 SYNC cut → acceptable
Power · space	3kW, ceiling 2.9m, dolly OK	15kW, 4.5m, crane OK	Crane cut (04) moved to the L-01 stair landing
Cost · permits	Rental 3.5h, insurance ✔, parking for 2	Rental 8h, parking for 10	Within budget → L-01
Rain plan	No direct window sun → recreate with key light	No impact	Backup day D+2, extra LED 600W on standby

SPREAD 03 · Casting

Actor sheet — impression keywords and availability in the same panel

A casting page is not a row of headshots. First write **the impression the concept demands** as keywords, then put in the same panel how well each candidate fits them, along with schedule · fee · contract

terms. What the client approves is not a face but "what this person will do for 15 seconds."

Actor sheet · role A "someone starting the morning"

Candidate A — 1st choice ★

Impression ●●●●○ · 3 commercials

Available 4/9 · 4/11 · backup day ○

Image rights 1 year online+outdoor

Small smile, but the eyes smile first

Candidate B — 2nd choice

Impression ●●●○○ · 1 music video

Available 4/9 only · backup day ×

Image rights 6 months online

Big smile → "just the corners of the mouth"

Candidate C — alternate

Impression ●●○○○ · no experience

Available all days · backup day ○

Educational use only

Rehearsal +30 min · 1st choice for a student film

Plate PPM-3 Casting sheet — one frontal cut with the same background · same light, plus four lines (impression · availability · image rights · reason for choice). Write the reason in the language of the tone and manner.

Photos

Four cuts under the same conditions

- Neutral front · natural smile · profile · frame grab of movement
- Unretouched, same lighting — the point is comparison
- Selfies · glamour shots for reference only

Terms

Write these before the face

- Available dates, and whether the backup day works
- Fee unit (day/hour) and image-rights scope (media · term · region)
- Wardrobe sizes, allergies, preferred angle, companions

Direction memo

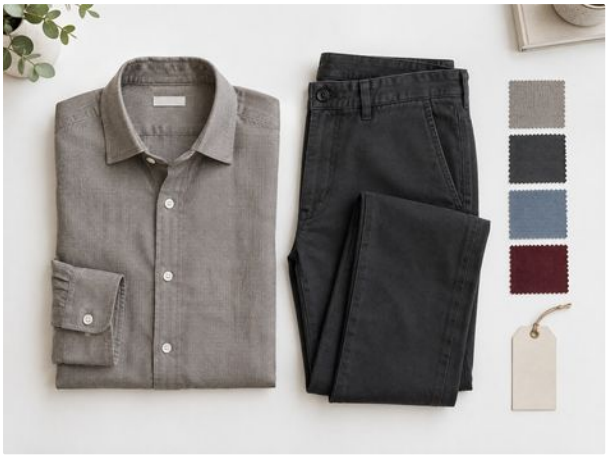
Agree in advance at the PPM

- One line on 'what to tell this actor not to do'
- Rehearsal time (+30 min if inexperienced)
- If there is SYNC dialogue, attach a voice sample

SPREAD 04 · Wardrobe · art · props

Wardrobe board and mise-en-scène map — name every object in the frame

Wardrobe board · mise-en-scène map (CUT 06)



LOOK 1 · Actor A

Linen shirt warm gray + cotton pants charcoal · CUT 02 · 03 · 05 · 06 · 1 spare set · banned: logos · stripes · pure white

LOOK 2 · Actor B

Knit dusty blue + off-white · CUT 05 · 2 value steps from A

1. Product — label facing front; wine color only here
2. Coffee cup — morning cue, the 60% color
3. Book + linen napkin — the 30% color, foreground depth
4. Window + blinds — shows where the light comes from
5. Eucalyptus — left negative space, leading line
6. Wood tabletop — texture keyword

Removed: menu · napkin holder · outlet · poster

Plate PPM-4

Wardrobe board and mise-en-scène map. If you cannot write "why it is there" for an object in the frame, remove it — that is all mise-en-scène is.

ated image — wardrobe · props · set documents

awn

Note

Slate — cut number · take tie sound to picture

SPREAD 05 · Schedule

Shooting schedule — built around 'light and actors,' not dates

TIP

Group the schedule not by scene order but by **location → light → actor availability**. Shooting cuts with the same location · same lighting setup back to back saves 80% of the time.

The shooting schedule is a table of "what we shoot on which day"; the shooting timetable (next page) is a table of "what we do at what time that day." Mix the two in one table and neither can be read.

Day	Time	Location	Cut (board)	Content	Cast	Key gear · lighting	Notes
DAY 1 · 4/9 (Wed) · café L-01 · sunrise 06:12 · direct window sun 07:00–10:00 · rental 07:00–10:30							
D1	07:00–07:30	Café 2nd floor	—	Setup: dolly track, key LED, art dressing	—	LED 600W, 4×4 bounce	Actor A call 07:15, makeup van
D1	07:30–08:30	Window table	02 · 03	Picks up bottle (MCU, dolly in) · a sip (CU)	A	50mm · 85mm, daylight + key boost	**Direct-sun cuts first**
D1	08:30–09:10	Window table	06	Ending: product centered, room for logo CG (dolly in, slow)	A	50mm, tracking markers, clean plate	CG reference cut — 1 LOCKED take required
D1	09:10–09:40	Window table	05	Clinks bottles with a coworker (2S)	A · B	35mm, fill bounce	B call 09:00, mostly from behind
D1	09:40–10:10	Tabletop	01 · 02 INS	Droplets ECU · hand insert	A's hand	Macro 100mm, glycerin	Fresh bottle swapped 6 times
D1	10:10–10:30	All	—	Wrap, restore the site, 1st backup	—	—	Dismiss after 3-2-1 backup
DAY 2 · 4/11 (Fri) · campus rooftop + lab · sunset 19:02 · golden hour 18:20–19:00							
D2	17:30–18:10	Rooftop stair landing	—	Setup: monopod tilt in place of crane, safety line	—	24mm, ND 8	Stop if wind exceeds 12m/s
D2	18:20–19:00	Rooftop	04	City morning (evening backlight stands in) LS tilt-up	—	24mm, 60fps	**Golden hour 40 min — 3 takes max**
D2	19:10–20:00	Lab	N recording	Record 3 narration lines, 30 sec room tone	Voice actor	Condenser, pop filter	3 takes each, timed to the board's 3 lanes
D2	20:00–20:30	Lab	—	2nd backup, dailies check, day wrap-up	—	—	Missed-cut list → backup day D+2
Backup day · 4/13 (Sun) · rain or missed cuts — Actor A availability confirmed ✔ · L-02 studio on hold							

Note — Schedule board — strips grouped by location · light · actor

Grouping order

Location → light → actor

- Same setups back to back
- 'Time you can't get back' first, like direct sun · golden hour
- Actor call 45 min before the first cut

Safety margin

+30% per cut, +1 hour per day

- The first cut is always 30 min late
- Travel: map time × 1.5
- Lunch is a fixed 45 min; push it and the afternoon collapses

Backup day

If it is not booked, it does not exist

- Hold both actor · location
- Set the rain threshold as a number (60% chance of rain)
- Finalize the missed-cut list at the day's wrap-up

SPREAD 06 · Shoot day

Shooting timetable and call sheet — draw it in 15-minute blocks and you see where it slips

NOTE

Bar length is planned time. When a block actually ends, draw the actual bar beside it in pen. That gap becomes the accuracy of your next project's schedule.

06:30	Advance team arrives · parking · power check · keys
07:00	Load in gear (2 people, stairs) · dolly track · key LED setup · start art dressing
07:15	Actor A call → makeup in van · wardrobe LOOK 1

Call sheet — one A4 page, to everyone by 20h the day before

Section	Content	Sample
Header	Project · shoot day no. · date · weather · sunrise/sunset · 2 production contacts	Morning drink 15s · DAY 1/2 · 4/9 (Wed) · clear 12→19°C · sunrise 06:12 · PD Kim OO 010-... / AD 010-...
Location	Address · parking · meeting point · restroom · hospital	12 OO-ro, Mapo-gu, 2F · back alley, 2 cars · 1F entrance · 1F · OO Hospital ER 1.2km
Call time	Arrival time by department (gear → production → cast → client)	Production 06:30 · camera/lighting 07:00 · Actor A 07:15 · Actor B 09:00 · client 08:15
Schedule	Shooting timetable summary (bar chart above)	07:30 CUT 02 → 08:00 CUT 03 → 08:30 CUT 06 → 09:10 CUT 05 → 09:40 INS → 10:10 wrap
Cast	Role · actor · call · makeup · wardrobe · manager contact	A lead · 07:15 · van · LOOK 1 · 010-... / B coworker · 09:00 · LOOK 2
Gear · art	Camera · lens · lighting list · props lead · product quantity	FX3 · 24/35/50/85/100M · LED 600W + 2 tubes · 6 product bottles chilled · glycerin
Safety · rules	Hazards · insurance · 3 set rules	2 people carry gear on stairs · never exceed 3kW · machine off 10 min during takes · smoking outside only
Contingency	Rain · delay thresholds and fallbacks · backup day	If no direct sun at 07:30, switch to key LED · if 2 hours late, CUT 05 moves to backup day · backup day 4/13

SPREAD 07 · Budget · risk · meeting

Budget line items and PPM meeting rules

Category	Items	Student project	Small commercial	Lock at the PPM
Labor	Directing, camera, lighting, editing	0 (team members)	Day rate	When overtime starts
Talent	Models, voice actors, extras	0 to small fee	Per-session contract	Image-rights scope · term
Gear	Camera, lens, lighting, gimbal rental	School loan	Daily rental	Damage insurance, return time
Location	Rental fee, cooperation fee	Free, as a favor	Hourly rate	Overtime fee, restoration scope
Art	Props, wardrobe, sets	At cost	Itemized	Product quantity, consumables
Post	Grading, sound mixing, CG	Done in-house	Outsourced rates	Number of revisions (usually 2)
Music	License purchase	Shared subscription	Per track or subscription	Media · term of use
Other	Meals, transport, insurance	At cost	10% of total in reserve	**State a 10% contingency**

Always set aside a contingency

Without 10% of the total budget held in reserve, the project stops the moment rain, a late arrival, a gear failure, or a reshoot occurs. In a student project, securing one backup shooting day does the same job.

Risk table — what could happen, what to do when it does, who decides

Risk	Trigger	Fallback	Decides
Rain · overcast (no direct sun)	D-1 at 20h, rain chance 60% or more	Recreate window light with key LED, or backup day	Director + DP
Actor late · no-show	Unreachable at call +30 min	Shoot insert · product cuts first, call Candidate B	Production PD
Gear failure	No spare body	Emergency swap from rental house (contact on call sheet)	DP
Rental overrun	Not packed up by 10:15	Agree on a 30-min extension fee in advance	Production PD
Client change request on set	Cut not on the board	Shoot after an 'additional cut request' is signed; billed separately	Production PD + client

Note Three people at the monitor — direction · camera · production see the same picture

Meeting rules

01 Send materials 48 hours before the meeting. No one can decide on material they first see in the room.

02 Mark each item decided or on hold. Record an owner and a deadline with every hold.

03 Always review references together on screen. Describe a tone in words, and everyone imagines it differently.

04 Share the minutes the same day. By the next day, memories differ.

05 There is one exit condition: every attendee must be able to say what they will do on shoot day.

06 After the PPM, accept changes only through a change request. It states the cost · schedule impact and is signed by the approver.

Exercise 2.2

Task	Make a mock PPM deck (twelve pages), split the teams into advertiser · production company roles, and run the meeting.
Tip	Include all of these: tone and manner board, location sheet, casting sheet, wardrobe · mise-en-scène map, schedule, call sheet, budget · risk tables. Don't forget the one anti-reference panel.
Assessment	Agreements recorded, questions handled, owner · deadline stated for items on hold
Model answer	Shares the minutes and the list of decisions within 1 hour of the meeting's end.

Exercise
2.2

Task	Write a two-day shooting schedule, a one-day shooting timetable (15-minute blocks), a call sheet, and a budget sheet.
Tip	Group by location → light → actor. Do not underestimate travel and setup time. Keep a 10% contingency and one backup day.
Assessment	Realistic schedule, no missing budget items, concrete risk fallbacks
Model answer	After the real shoot, draws the actual bars beside the planned ones, records the gap, and feeds it into the next plan.

Background 9

Archetypes of story — from the Poetics to the hero's journey

From a 15-second ad to a 90-minute film, stories that grip people share recurring structures. In the Poetics, Aristotle named plot, the arrangement of events, as the most important element of tragedy. A story must be a complete action with a beginning, middle and end, and its events must connect by necessity or probability. "Reversal," where a character's fortune turns, and "recognition," where an unknown truth comes to light, move the audience most. Today's twist-ending ads follow the same principle.

In 1863, the 19th-century German writer Gustav Freytag organized dramatic structure into five stages: exposition, rising action, climax, falling action and catastrophe. "Freytag's pyramid" describes a story as a curve of tension that rises and falls. In East Asia, gi-seung-jeon-gyeol, the four-part form born of the classical Chinese quatrain, has played a similar role. Because the direction changes at the third part, the "turn," it suits short videos especially well.

In the 20th century, the mythologist Joseph Campbell argued in The Hero with a Thousand Faces (1949) that myths around the world follow a similar journey: a hero leaves the ordinary world, undergoes trials and returns transformed. Christopher Vogler reworked this into a screenwriting method in The Writer's Journey, and Syd Field popularized 3-act structure and plot points in Screenplay (1979).

Use these structures as formulas and the story turns predictable. But understand why they work and you can use them differently. The audience enters a story when

they know what the character wants, tenses up when that desire is blocked, and is moved when the character makes a choice. Make three things clear — desire, obstacle, choice — and the story lives, whether in four parts or 3 acts.

The same goes for brand films. The audience accepts a story when a person, not the product, is the protagonist, and the product is the helper that gets that person over the obstacle. The planning in this PART comes down to deciding whose desire, and which desire, to set before which obstacle.

Further reading: Aristotle, Poetics · Joseph Campbell, The Hero with a Thousand Faces · Robert McKee, Story

PART 02 Planning and pre-production

2.3 A map of the whole production pipeline

Professionals spend half their time preparing. The cost of poor preparation grows exponentially.

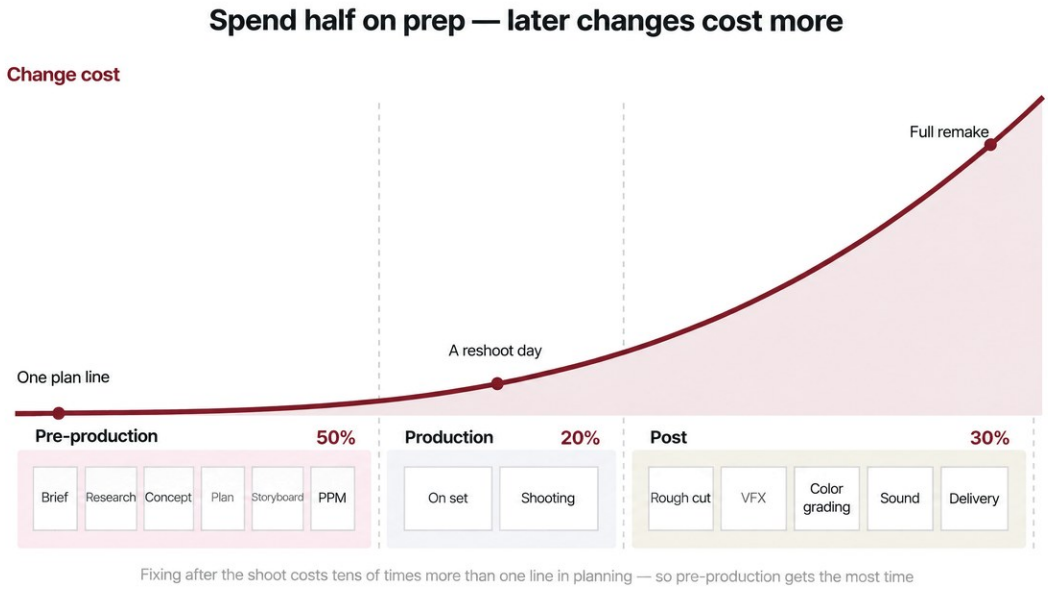


Figure 23 Map of the whole video production pipeline

01

Pre-production

Brief › research › concept › synopsis › proposal › rough boards › storyboard › PPM › scouting

02

Production

Shooting

03

Post-production

Rough cut › compositing › color › sound › delivery

50%	20%	30%
Pre-production — proposal, storyboard, PPM document	Production — camera originals, set logs	Post-production — final master, versioned exports

Note

Each stage has its most common failure: going into the shoot with the concept unsettled, too little coverage, and trying to fix in post what wasn't made on set.

What 50 percent means — the cost of change

If a change costs 1 at the concept stage, it costs 3 times as much at the storyboard stage, 5 times at the PPM, 20 times on the shoot day and over 50 times in post-production. Student projects are no exception.

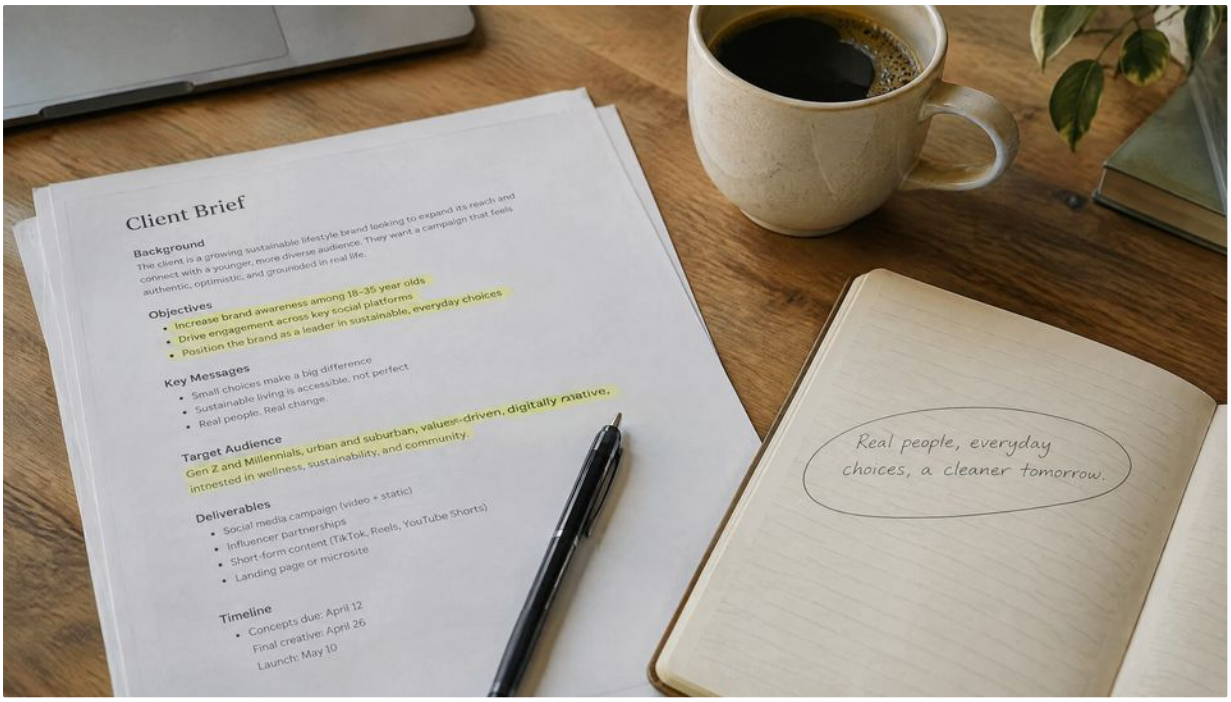
Exercise 2.3

Task	Draw the production pipeline of a hypothetical 30-second ad as a schedule, from planning to delivery.
Tip	Write down each stage's deliverable (proposal, storyboard, footage, edit).
Assessment	Missing stages, realism of the schedule
Model answer	Marks the approver and the number of feedback rounds for each stage.

PART 02 Planning and pre-production

2.4 Reading the brief and planning intent

The key to reading a brief is telling what was asked for from what is actually needed.



Note How to read a brief — where the highlighter stops is where the concept starts

Brief

A client's request, contest guidelines and a professor's assignment terms are all briefs.

Every video starts from someone's need. Each item in a brief has its own things to ask and things to lock down.

Brief item	What to ask	What to lock down
Goal	Awareness, conversion or branding	One metric
Target	Whether buyer and user are the same	A concrete profile of one person
Key message	Several, or just one	One sentence, 15 syllables max
Differentiator	Something competitors can't claim	A form that can be proven visually
Media	Where it runs, and how much	Specs, length, muted or not
Restrictions	Any legal limits on wording	List of banned words and claims
Budget and schedule	How many shoot days	Shoot sessions and post period
References	What the client likes	3 agreed tone-and-manner videos

The final output of reading a brief is a single sentence

This ad makes [whom] feel [what] [in what way]. If you can't write this sentence, don't draw the storyboard.

> A plan that starts with pictures always collapses midway.
>
> 2.4 Reading the brief and planning intent

Exercise
2.4

Task	Pick a real contest brief and summarize its core task, target, message and constraints on one page.
Tip	Don't copy the brief's wording; rewrite it as a "one-sentence task."
Assessment	Clarity of problem definition
Model answer	Uncovers hidden tasks not written in the brief.

PART 02 Planning and pre-production

2.5 Generating ideas: the 6 Thinking Hats

Everyone wears the same color hat and thinks in the same direction, then moves on to the next hat.

Note Ideas happen on the wall — Post-its are good because they're easy to toss

6 Thinking Hats

A thinking technique proposed by Edward de Bono. It prevents the confusion of one person juggling several perspectives at once.

White hat

Facts and data

- The target's actual viewing time?
- Competitors' view counts? Budget?

Red hat

Feelings and intuition

- How does this idea make you feel?
- Exciting or boring?

Black hat

Risks and criticism

- What could go wrong?
- Scenes that can't be shot?

Yellow hat

Value and optimism

- Biggest strength?
- If it succeeds, why?

Green hat

Creativity and alternatives

- Another way to do it?
- What if we flip it?

Blue hat

Process control

- Where are we now?
- What do we need to decide?

Sample meeting agenda (60 min)

01 Blue hat 5 min — state what must be decided today.

02 White hat 10 min — share only data and facts. No opinions.

03 Green hat 15 min — pour out ideas in quantity. No criticism.

04 Yellow hat 10 min — name only each idea's strengths.

05 Black hat 10 min — check the risks.

06 Red hat 5 min — vote for the option your gut picks.

07 Blue hat 5 min — record decisions and next steps.

Supporting ideation techniques

TIP

Use AI expansion only to widen the range of ideas. Get 20, then a person narrows them to 3.

Forced connection

Link two unrelated words to the product

- Chance combinations break conventions

Reversal

Flip every convention of the category

- Differentiation happens instantly

Extreme scaling

A scene exaggerating the benefit 100 times

- Starting point for exaggerated-metaphor ads

A day with the user

Log the target's 24 hours, hour by hour

- Find the moment the product can step in

Pain list

Of 20 pain points, the ones the product solves

- The safest method

AI expansion

Set conditions, get 20 → a person cuts to 3

- Only for widening the range

Exercise 2.5

Task	Run a team meeting with the 6 Thinking Hats and collect 30 or more ideas.
Tip	Limit each hat to 5 minutes.
Assessment	Quantity and variety of ideas, selection criteria
Model answer	Takes a weakness raised under the black hat and flips it with the green hat into a new idea.

PART 02 Planning and pre-production

2.6 Concept types and testing

A concept starts from one of six types and is tested with five questions.

Problem-first

Pain first, solution after

- Safest and quickest to grasp

Exaggerated metaphor

Blows the benefit up into an unreal metaphor

- Memorable, but risks hiding the product

Demo test

Proves performance physically

- Highly credible; needs shooting skill

Emotional story

A short story, then the brand

- Hardest to pull off in 15 seconds

Twist

Grabs attention with an unexpected ending

- Strongest when paired with a 3-second hook

Convention-breaking

Breaks the category's clichéd images

- Instant differentiation

TIP

A good test question asks for "the one thing you remember."

Concept test questions

Test question	Pass criterion
Understood with the sound off	A must for short-form and social media
Still works with a competitor's logo	If so, differentiation has failed
Brand recognizable from the last 3 seconds alone	If not, redesign how the logo appears
Explainable in one sentence	If the explanation is long, the audience won't get it
Shootable within budget and schedule	If not, it's a daydream, not an idea

Exercise 2.6

Task For one product, write one-line informational, emotional, humorous and problem-solving concepts, then test them on 5 people in the target.

Tip A good test question asks for "the one thing you remember."

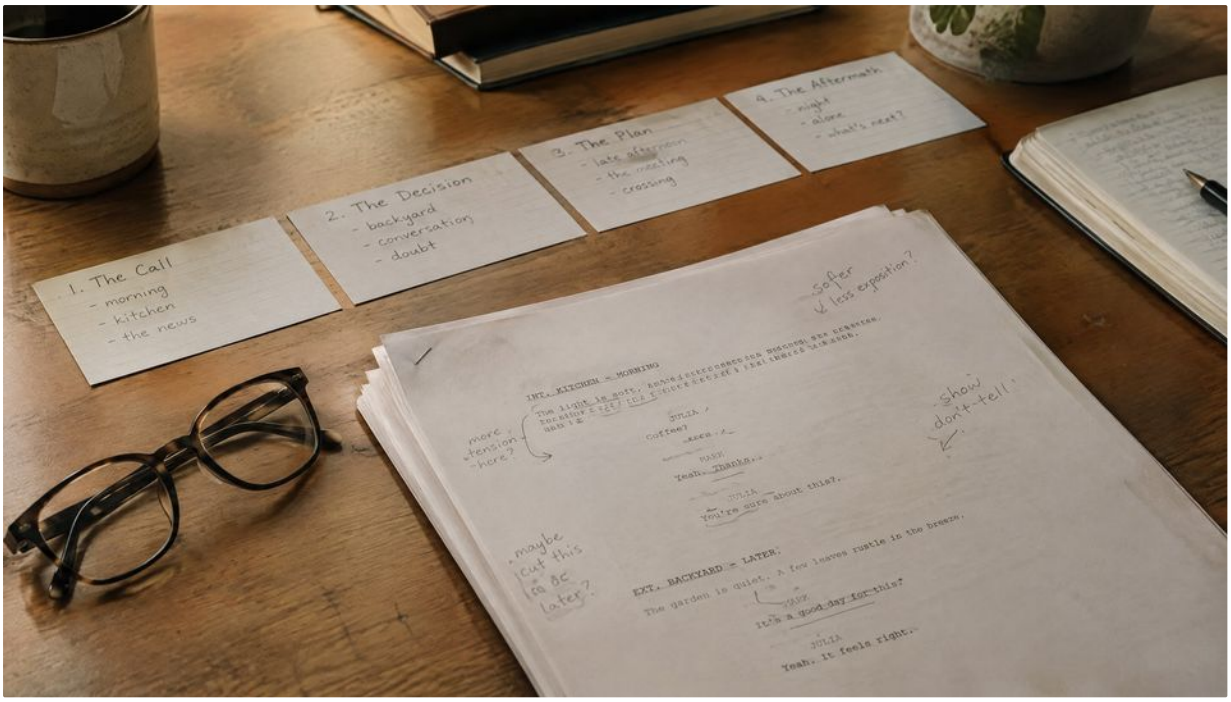
Assessment Distinctiveness of concepts, use of test results

Model answer Shows how the concept was revised once based on the test results.

PART 02 Planning and pre-production

2.7 Synopsis, treatment, screenplay

A story takes shape in five steps, from one sentence to a shot list.



Note A screenplay page — notes in the margin become directing notes

01
Logline

A skeleton in one or two sentences. Protagonist, goal, obstacle

02
Synopsis

The whole story in about a page. Reveals the ending

03
Treatment

Prose expanded scene by scene. Flow and mood, no dialogue

04
Screenplay

The formal script, with scene numbers, locations, times, action notes and dialogue

05
Shot list

Scenes broken into cuts. Size, angle, camera move, lens, est. time

TIP

In a screenplay, 1 page is about 1 minute of screen time. Action notes cover only what is seen and heard.

Sample screenplay format for a 15-second ad

S#1. Morning kitchen / INT / Morning — Light comes in through the window. The product sits on the table. Minseo (24) walks in, still half asleep, and picks up the product. N(V.O.) Your day starts differently. Minseo takes a sip; eyes close, then open. SE bottle cap opening / M piano in

Exercise
2.7

Task	For a 3-minute short, write a synopsis (5 lines), treatment (1 page) and screenplay (3 pages), in that order.
Tip	In a screenplay, 1 page is about 1 minute of screen time. Write only what is seen and heard in action notes.
Assessment	Adherence to format, development at each step
Model answer	Writes so the character's desire shows in action, even without dialogue.

PART 02 Planning and pre-production

2.8 Writing a proposal

A proposal is a persuasive document. The goal is to let the reader play, in their head, a video that doesn't exist yet.

Note Pitching a proposal — if it can't be explained on one page, it isn't a plan yet

Standard proposal contents

No.	Section	What goes in	Length
01	Cover	Title, subtitle, makers, date, 1 key visual	1 page
02	Background	Why this video, why now. The market and the target's situation	1 page
03	Goal	One of awareness, conversion or branding, plus a metric	Half page
04	Target	A single persona. Daily routine and media habits	1 page
05	Key message	One-sentence concept and its rationale	Half page
06	Tone and manner	Mood board, color palette, 3 references and why they were chosen	1–2 pages
07	Synopsis	Full story and structure (hook, development, close)	1 page
08	Storyboard	Picture, action notes and sound for each cut	1–3 pages
09	Production plan	Schedule, locations, cast, equipment, team roles	1 page
10	Budget	Itemized costs and total	1 page

No.	Section	What goes in	Length
11	Distribution plan	Versions per platform, posting schedule, hashtag strategy	1 page
12	Expected impact and risks	Projected results and contingency plans	Half page

Five ways to strengthen a proposal

TIP

For tone and manner, three images are more precise than ten adjectives.

01 Put the conclusion first. Place the one-sentence concept and a key frame on the page right after the cover.

02 Speak in pictures rather than words.

03 Include numbers. Specific figures such as 15 seconds, 6 cuts, 1 shoot day and 2 cast members build trust.

04 Write down what's impossible up front. Presenting risks with alternatives actually raises trust.

05 Narrow the options to two. Three or more delay the decision; one looks like an ultimatum.

Example: a 1-minute short-form video promoting a university

Section	Example
Title	What do you learn here? - a 1-minute department vlog
Background	High schoolers look for college info on short-form, not department websites. Existing promo videos just list facilities, so nobody watches to the end.
Goal	Raise awareness. Metric: average view retention of 60% or more
Target	A, a female 2nd-year high school student. Undecided on her path; watches over 90 minutes of short-form a day
Key message	In this department, you handle cameras all day
Concept type	Convention-breaking. Shows only students' hands and gear, not campus panoramas
Structure	0–3 s shutter sound and hand close-up / 3–45 s a day's routine in 8 cuts / 45–60 s department name and how to apply
Tone and manner	Natural light, handheld, caption-driven, assumes muted viewing
Production plan	1 shoot day, 2 current students as cast, 1 mirrorless camera and gimbal, lab and campus
Distribution plan	Department Instagram Reels, YouTube Shorts, shared by the school's official account. 12 hashtags
Risks	3 indoor backup cuts secured in case of rain. Cast release forms collected in advance

Sample topic ideas

Comparing restaurants near school, how to use the free shuttle bus, tips for living alone and recycling, comparing two campus cafeterias, a 1-day college student vlog, the department's gear, club promotion, a tour of hidden campus spots.

What topics from real classes share is that they are all things only current students know. Start not from what nobody knows, but from what only you know.

Exercise 2.8

Task	Write a 5-page proposal for a contest entry (task, insight, concept, storyboard, expected impact).
Tip	One sentence on the first page should sum up the whole.
Assessment	Logical flow, effectiveness of visuals
Model answer	Backs up insights with data or interview evidence.

PART 02 Planning and pre-production

2.9 Team roles and collaboration

Name one decision-maker. If everyone is directing, no one is.

Note Roles at the monitor — one decision-maker

Role	Responsibility	On the shoot day
Director	Decides what to show and how	Judges takes, directs actors, calls OK
DP	Technical execution of the image	Camera settings, framing, exposure, focus
Gaffer	Designs and executes the light	Light placement, output control, safety

Role	Responsibility	On the shoot day
Sound	Records on-set audio	Mic handling, level monitoring, room tone
Producer (PD)	Schedule, budget, booking, running the day	Timekeeping, location liaison, data backup
Script supervisor	Shoot records	Logs takes per cut and which are OK
Art, props	Objects in frame	Dressing, keeping the product camera-ready
Editor	Shapes post	Observes on set or checks rough-cut needs

Roles in small teams

1 person
30–40 s

- Does every role
- Plan around a tripod and locked-off shots

2 people
40 s–1 min

- Director doubles as camera
- Producer doubles as sound

3 people
1 min–1 min 30 s

- Director / camera
- Producer doubles as lighting

4 or more
1 min 30 s–2 min

- Director / camera / lighting / producer, all separate

Seven rules for collaboration

01 Name one decision-maker.

02 Rotate roles. In student projects, trying every role once is the learning goal.

03 Agree on file naming on day one. Fix the order: date, scene, cut, version.

04 Set up the shared folder structure in advance. After the shoot is too late.

05 Give feedback while watching, pinned to specific times.

06 Set the internal deadline one day before the real one.

07 Say what went well first. A team lasts because of relationships, not skills.

TIP

Give feedback while watching, pinned to specific times. "It's just not quite there overall" doesn't help.

Exercise
2.9

Task	Create a role chart and communication rules (channels, response times, file rules) for a 5-person team.
Tip	When one person holds two roles, check where the times overlap.
Assessment	Clarity of roles, following the communication rules
Model answer	Documents a team retrospective after the deadline.

PART 02 Planning and pre-production

2.10 Entering contests and writing proposals

Contests are a way to gain both a portfolio piece and production money. But most entries that don't understand how judging works are cut in round 1.

01	02	03	04
Round 1: documents	**Round 2: plan**	**Round 3: production**	**Final judging**
Fit with the theme and feasibility — use the guidelines' exact words	Distinctiveness and specificity — submit a one-sentence concept and storyboard	Polish and meeting deadlines — never miss an interim report	Message delivery and technical polish — adjust emphasis to the jury

What rejected entries have in common

- They didn't read the guidelines. Surprisingly many proposals never once use the theme's keyword in the text.
- They wrote only what they wanted to make. A contest is a tool for achieving the organizer's goals.
- It isn't feasible. A shoot plan too big for the budget and schedule loses points immediately.
- It isn't different. Hundreds of entries come in on the same theme. You must be able to say in one sentence what sets yours apart.
- They didn't check copyright.

Note

Awards keep getting revoked over music and font copyright issues.

One-page proposal summary form — ten items

Title / one-sentence concept / target / key message / structure (0-3 s, 3-45 s, 45-60 s) / 1 key visual / production schedule / budget / differentiator in one sentence / 1 impact metric. If these ten don't fit on one A4 page, the plan isn't sorted out yet.

Exercise 2.10

Task	Pick a real contest and finish the application and proposal to a ready-to-submit level.
Tip	Check the guidelines' specs, copyright clauses and submission format first.
Assessment	Compliance with the guidelines, persuasiveness
Model answer	Reverse-engineers the judging criteria into the proposal's table of contents.

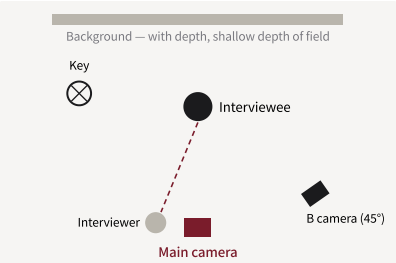
PART 02 Planning and pre-production

2.11 Planning and shooting interview videos

Interviews are the most commonly commissioned format, and they expose your basics in lighting, mics, framing and editing all at once.

Note 2-camera interview setup — eye-level key, interviewer just off axis

Interview — two cameras, one gaze



Setup from above
Interviewer right beside the lens — the eyeline is nearly frontal yet relaxed, like a conversation

Main — looks beside the camera
Leave space (look room) in the direction of the gaze

B camera — catches expressions
Close-up from 45° to the side, a breathing hole for the edit

Figure 24 Standard interview setup and the resulting frames. Staring into the lens creates tension — seat the interviewer beside the lens.

Preparation

TIP

Book twice the shooting time you actually need. It takes time for nerves to settle.

01 Write and share the questions in advance, but use them only as a frame for conversation, not a script to read.

02 Ask the subject to include the question in each answer. The questions get cut in the edit.

03 Check the location in advance: quiet, with depth in the background and a usable window.

04 Advise on wardrobe colors beforehand. Avoid the background's color, fine stripes and big logos.

05 Book twice the shooting time you actually need.

Shooting setup

Element	Basic setup	Why
Camera	2 cameras: main medium, B close-up	Avoids jump cuts in the edit
Framing	Eyes on a rule-of-thirds intersection, space in the gaze direction	Stable and natural
Eyeline	Subject looks at the interviewer beside the camera	More relaxed than staring into the lens
Lighting	Key light at 45 degrees, reflector fill, backlight	Dimension and separation from the background
Background	A deep space, shallow depth of field	Focus on the subject
Mic	Lavalier + shotgun, double recording	Backup against failure
Room tone	Record 30 seconds after wrapping	Fills gaps in the edit

Editing tips

— Find the single best answer sentence first and build around it.

B-roll

Related footage laid over the points where jump cuts occur.

— Cut verbal tics and filler, but take care not to change the meaning.
— Lay B-roll over jump cuts. Use captions to highlight only key sentences, not everything.
— Building in a review by the interviewee before finishing prevents disputes.

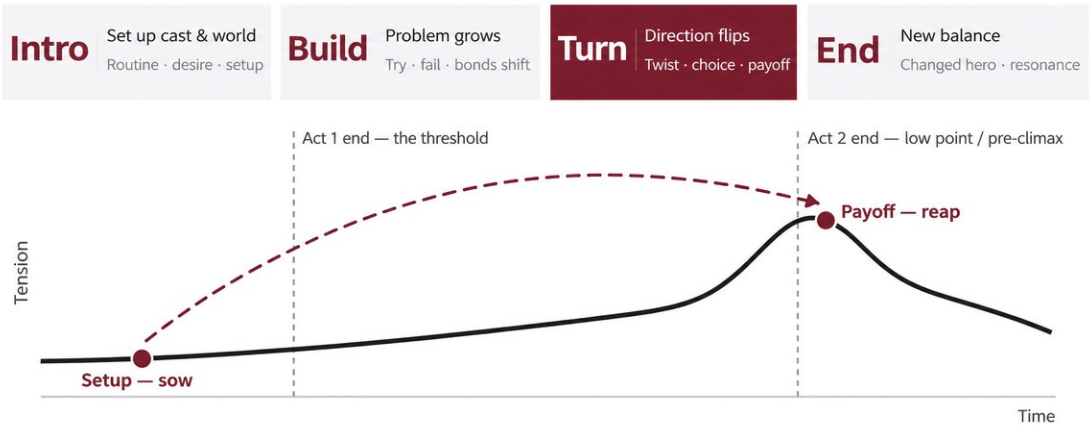
Exercise 2.11

Task	Interview a senior student or a professor in your department and make a 3-minute video.
Tip	Prepare 10 questions, but when a good answer comes, follow it.
Assessment	Lighting · audio · eyeline, flow of the edit
Model answer	Shows what the interview describes with B-roll so it isn't just a talking head.

PART 02 Planning and pre-production

2.12 Seven concepts that drive film: from structure to emotion

Before technique, film stands on a few agreements. These seven concepts work the same in a 15-second ad and a 90-minute film.



East Asia's 4-part gi-seung-jeon-gyeol and Hollywood's 3-act design — both curves of 'change'

Figure 25 Four-part and 3-act structure — planting and paying off setups along the curve of tension

1 Structure · 2 Screenplay · 3 Setup and payoff

25%
Act 1 (setup) — at its end, the character crosses a threshold of no return

50%
Act 2 (confrontation) — at its end, the character hits the lowest point

25%
Act 3 (resolution) — a new balance

Chekhov's gun

A gun hung on the wall in Act 1 must be fired in Act 3. Pay off what you plant, and plant only what you will pay off.

Structure

Four parts and 3 acts

- Setup: characters and world / Development: the problem grows / Turn: change of direction / Resolution: new balance
- The shorter the video, the more one moment of the "turn" decides the whole

Screenplay

Write only what is seen and heard

- Scene heading (place · time), action notes, dialogue
- Don't write inner thoughts; show them in action
- 1 page = about 1 minute of screen time

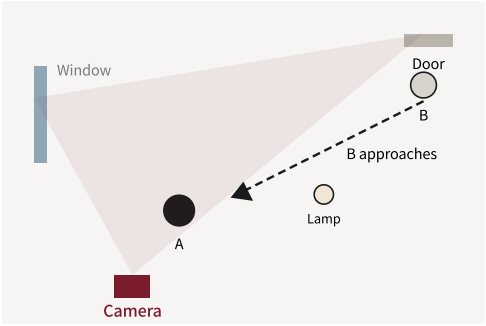
Setup and payoff

Make a promise and keep it

- Plant setups so naturally the audience overlooks them
- Payoffs clear enough to bring back the earlier scene

Two people in one frame

The camera's view
Foreground A — big, dominant · Background B — small, in the doorframe, distance, tension



Blocking, top view
Mise-en-scène = all that's in the frame · Blocking = planned moves of actors and camera

Figure 26 Mise-en-scène and blocking — placement in frame and moves seen from above. Depth (foreground · background) tells the relationship.

4 Actor and subject · 5 Mise-en-scène · 6 Acting · 7 Emotion

Actor and subject

Read by size · position · light · direction

- Small at the edge: isolation
- Large in the center: control

Mise-en-scène

"Put in the scene"

- Placing actors, space, props, costume, light, color
- Shows relationships and power in one frame. Pairs with montage

Acting

Smaller reads bigger

- In close-up, eye movement and breath are enough
- Give actions and goals, not emotions
- Reaction is half of acting

Emotion

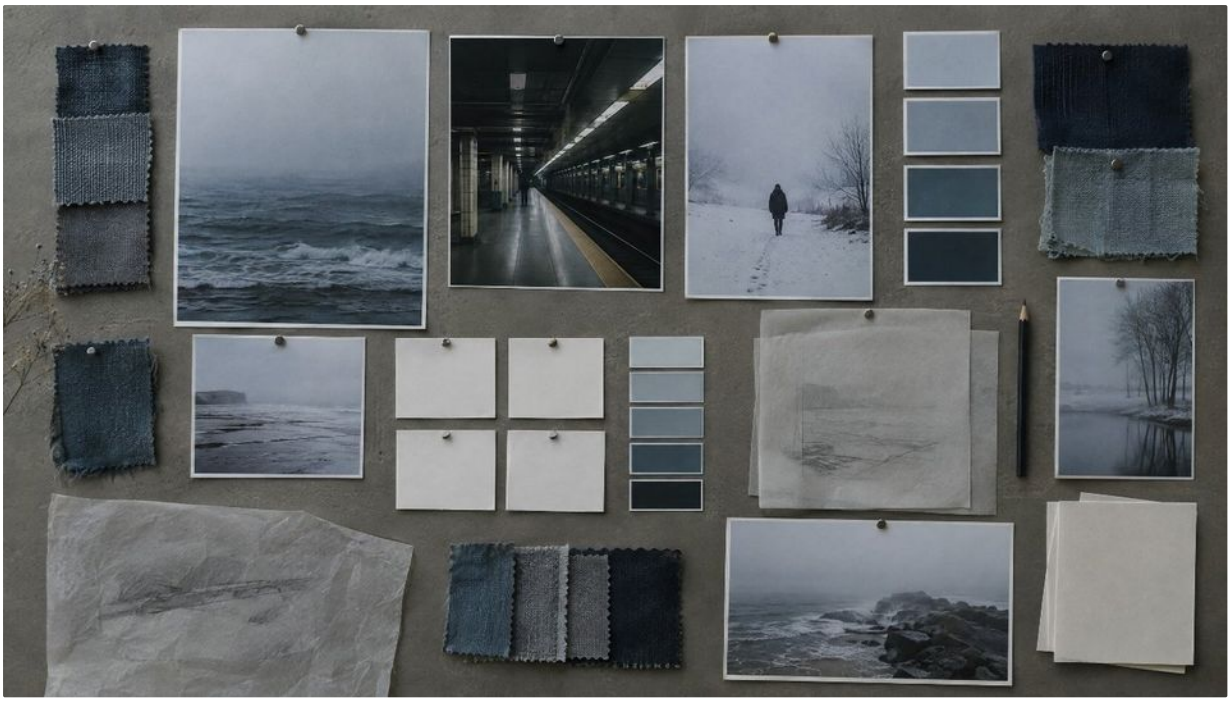
The audience's part

- The audience does not copy a character's emotion
- Design the order: desire · obstacle · choice

> "Wait until that person answers the phone" draws more precise acting than "Be sad."
>
> 2.12 Seven concepts — acting

Lines to use on set

Structure is order, a setup is a promise, mise-en-scène is placement, acting is action, emotion is the audience's part. Write these five lines on one page before the shoot.



G-19 Adjective-keyword mood board — "cold, still, lonely"

Exercise
2.12

Task	Plan a 3-minute short's four-part structure in four panels, then write a script with one setup and one payoff.
Tip	Make the setup natural enough for the audience to pass over, and the payoff clear enough to make them look back.
Assessment	Structural balance, setup-payoff link, character's emotional arc
Model answer	The ending of The Sixth Sense and the scenes before it. A prop from the first scene flips the meaning of the last.

Background 10

Design thinking and the language of feeling

Setting a world with adjectives may look like pure instinct, but it rests on methods long refined in design research and psychology. In The Sciences of the Artificial (1969), Herbert Simon defined design as "action that turns the current state into a better one," widening it from a branch of art into a method of problem solving. Later, IDEO and the Stanford d.school popularized the stages of empathize, define,

ideate, prototype, and test, and the term "design thinking" came into wide use.

The classic study using adjectives as a measuring tool is psychologist Charles Osgood's semantic differential. In The Measurement of Meaning (1957), he had people score their impressions on pairs of opposite adjectives such as "good-bad," "strong-weak," and "fast-slow." Placing adjectives on sensory axes in section 2.13 applies exactly this principle.

In the 1970s the Japanese engineer Mitsuo Nagamachi systematized "Kansei engineering," which gathers users' feelings about a product as adjectives and turns them into concrete design elements. It translates the vague sense of a "sporty car" into design values such as body lines, seat height, and dashboard color. The tone-and-manner chart, which turns adjectives into color, light, lens, and cutting pace in video, has the same structure.

The adjective method is especially useful because it aligns the team's language. The director's "warm," the DP's "warm," and the editor's "warm" can all differ. A mood board and a tone-and-manner chart bring these differences out before the shoot and get the team to agree. Ask first-time viewers of the finished piece which adjectives come to mind, and you can check whether the intended world came through.

Design thinking, in the end, is refusing to leave creativity to chance and making it a repeated cycle of observation, definition, and experiment. Three adjectives are where that cycle starts and where you return when lost.

Further reading: Herbert Simon, The Sciences of the Artificial · Tim Brown, Change by Design · Charles Osgood et al., The Measurement of Meaning

PART 02 Planning and pre-production

2.13 Design thinking that builds a world from adjective keywords

Set the goal with adjectives (how) rather than nouns (what), and your choices of color, light, lens, pace, and sound line up all at once.

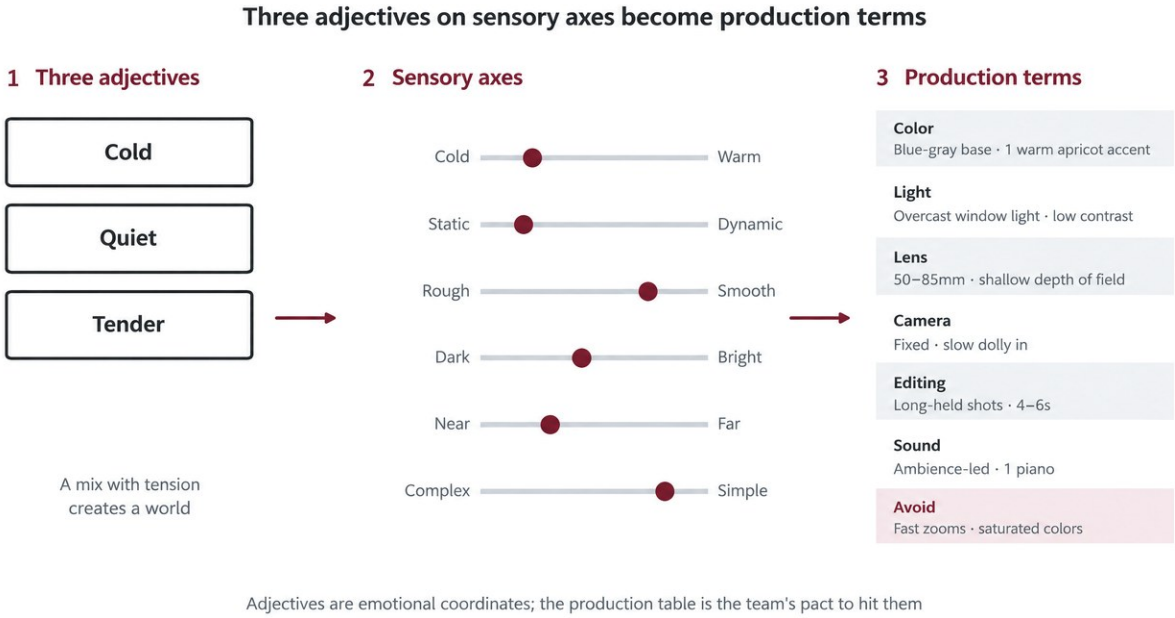


Figure 27 Adjective-keyword design thinking — 3 adjectives, sensory axes, translation into production language

A good video sits inside one world from the first cut. Adjective keywords are the fastest tool for getting the whole team to build that world in the same direction.

The five stages of design thinking

01	02	03	04	05
Empathize	Define	Ideate	Prototype	Test
Observe · interview the target's viewing context and mood. Collect their adjectives	Pick 3 of the collected adjectives	A mood board of 10 images per adjective. Plot them on sensory axes (cold-warm, static-dynamic)	Turn it into a tone-and-manner chart and 3 test cuts. Color · light · lens · camera · editing · sound · don'ts on one page	Show the test cuts to 5 first-time viewers and ask for adjectives. It works if 2 or more intended ones come up

TIP

Combinations with tension (cold · still · tender) make a more distinctive world than ordinary ones (bright · cheerful · exciting).

Adjectives into production language

Still

A frame at rest

- Static shots, long takes
- Ambience-led, minimal dialogue

Sharp

Hard-edged light

- Hard light, wide lens up close
- Short cuts, metallic SFX

Tender

Faces up close

- Diffused window light, one warm color
- Detail inserts, such as hands

G-20 Mise-en-scène and blocking — actors · lighting · art · camera in one frame

> When a meeting drags on, go back to the 3 adjectives. Simply asking whether this cut honors all three settles most choices.
>
> 2.13 Lines to use on set

Exercise
2.13

Task	Define the world of a fictional brand film with 3 adjective keywords, then make 1 mood board and a tone-and-manner chart.
Tip	Pick adjectives with tension between them (e.g., cold · tender · slow).
Assessment	Consistency of keywords with color · light · lens · music · cutting pace
Model answer	Makes a "don'ts" list for each keyword to mark the world's borders clearly.

PART 02 wrap-up

Exercises and review

01 **1-minute short-form proposal**

Write a 12-item proposal about your school or neighborhood.

02 **Thinking hats meeting**

Run a 60-minute team meeting with the 6 thinking hats method and keep minutes.

03 **6-cut storyboard**

Turn your plan into a 6-cut storyboard, using every notation symbol.

04 **Animatic**

Load the storyboard images into an editing program and build an animatic with temp music.

05 **12-item PPM document**

Once it is written, ask teammates what they do on shoot day. If they can't answer, the document falls short.

One-page summary

2.3 Production pipeline	50% goes to preparation. Cost of a change: concept 1x, storyboard 3x, PPM 5x, shoot day 20x, post 50x.
2.4 Reading the brief	The end product is one sentence. This video makes whom feel what, and how.
2.5 Thinking hats	Everyone wears one color and thinks one way, then switches hats. A 60-minute meeting opens and closes with the blue hat.
2.6 Testing the concept	Is it clear with the sound off? Does it hold with a rival's logo on it? Do the last 3 seconds alone reveal the brand?
2.7 From synopsis to shot list	Logline › synopsis › treatment › script › shot list. 1 page of script runs about 1 minute.
2.8 The proposal	A standard 12-item outline. Conclusion on page one; speak in pictures, include numbers, flag risks up front, offer two options.

2.1 Storyboard	Not drawing skill but a device that makes ten people imagine the same frame. For short-form, take it to an animatic.
2.2 PPM	Materials out 48 hours ahead; minutes shared the same day. Done when everyone can say what they'll do on shoot day.
2.9 Team roles	One decision-maker. File rules and a shared folder on day one; internal deadlines a day early.
2.11 Interviews	2 cameras, dual recording, 30 seconds of room tone. Have answers include the question; cover jump cuts with B-roll.
2.12 Seven concepts	Structure is order, setup a promise, mise-en-scène placement, acting action, emotion the audience's part.
2.13 Adjective keywords	Define the world with 3 adjectives in tension and translate them into color · light · lens · pace · sound.

Questions to consider

Q **What is my project's one-sentence concept? Would it still work with a rival's logo on it?**

If it would, you have failed to differentiate. Look again for what rivals can't say, in a form you can prove visually.

Q **Have you put off any decision until shoot day? What changes if you make it now?**

A change on shoot day costs 20 times what it costs at the concept stage. Send meeting materials 48 hours ahead, share decisions in writing the same day, and always secure a 10% contingency and one spare shoot day.

MEMO · PART 02

PART

03

What you make in this PART

1. Manual exposure setup order
2. Preset table by situation
3. 1-minute smartphone interview

Camera gear and technique

A camera is a device that records light. How much light, for how long, and how sensitively? Understand these three and the order of operation is the same on any model. This PART answers the question "How do I shoot good video?" not with numbers but with an order of judgment.

Photo P-03 Aperture and focus rings on a cinema camera · generative image

Using this chapter in class

Understand the exposure triangle and set exposure manually

Materials Mirrorless camera or smartphone pro mode, ND filter, light meter app

10 min	15 min	10 min	10 min	5 min
Intro	Concepts	Plates	Exercise	Wrap-up
Compare the same scene shot in auto and in manual	Lock the shutter, set base ISO, direct with aperture. Why this order	Walk through the frame-rate stack and the shutter-angle disc	Shoot one scene at F2.0 and at F8, log the adjustments	Hand out the preset table

> Check point
>
> Can they explain what they locked first when changing exposure

PART 03

Introduction

A camera is a device that records light. Grasp this one sentence and the order of operation is the same on any model. How much light to let in, for how long, and how sensitively to receive it. Every other function supports these three.

The most common beginner mistake is leaving it all to auto. Auto exposure shifts brightness every time a cloud passes, and auto white balance gives each cut a different color. Footage is material that must cut together, so consistency comes before the polish of any single cut.

This part is full of numbers, but you don't need to memorize them. What you need is a feel for what you gain and lose when you turn each dial. Open the aperture and the background blurs, but focus misses rise; raise the sensitivity and the image brightens, but noise grows. Every choice has a price, and the DP is the one who knows the price and pays it.

Background 4

Lens and eye — machine vision and human vision

The camera is often likened to the eye, but the two do not see the world the same way. The human eye sees sharply only in a tiny area called the fovea; the eyes dart about, and the brain stitches the fragments into one scene. That is why we feel we can see a bright window and a dark room equally well at once.

A camera sensor records the whole frame under the same conditions in one instant, so the view outside blows out to white or the interior sinks into black. We study exposure and dynamic range because the maker must now decide what the eye used to do automatically.

Focal length is also commonly misunderstood. Strictly speaking, what changes perspective is not focal length but the distance between camera and subject. To fill the frame with a face on a wide lens you must get close, and that distance makes the nose look big. To get the same size on a telephoto you must step far back, and that distance makes the background look close. Perspective is changed by the camera's position, not the lens.

'Normal lens' is also closer to a convention. A full-frame sensor's diagonal is about 43mm, so focal lengths near it are taken as closest to natural perspective, and by custom 50mm is called normal. What matters more than the number is whether the audience takes the scene as 'seeing it up close' or as 'peeking from afar'.

The f-number is the ratio of focal length to the diameter of the aperture opening. f/2 has a larger opening than f/4 and lets in four times the light, and the larger the opening, the shallower the depth of field. Depth of field also varies with focal length, subject distance and sensor size, so for a shallow look you can also move closer to the subject or put the background farther away. Technical terms form one connected system.

In the end, a camera is not a device that imitates the eye but one that shows the world in ways the eye cannot. It freezes 0.1 seconds, stretches 1 second into 10, and sees from impossible heights and distances. The numbers in this chapter are the language for using that new vision as you intend.

Further reading — Blain Brown, Cinematography: Theory and Practice · Gustavo Mercado, The Filmmaker's Eye

PART 03 Camera gear and technique

3.1 A lineage of camera gear

Every time gear got lighter, a new visual language was born. Ask first what the physical traits of the gear in your hands make possible.

Note

In the 2020s, the gap in judgment, not in gear, decides the result.

Period	Gear	What changed
1895–1920s	Hand-cranked film camera	Speed depended on the hand; before frame rates were standardized
1930s–1950s	Blimped cameras for sync sound, the studio system	Heavy gear kept shooting indoors
1960s	Lightweight 16mm cameras, portable recorders	Cameras out in the field made documentary and the New Wave
1970s	ENG cameras, Steadicam	Newsgathering style and moving-camera language set in
1980s–90s	Home camcorders, the DV format	The start of an era when individuals own and make video
2008–2012	Video DSLRs	Large-sensor shallow depth of field, cheaply. The so-called DSLR revolution
2013–2019	Mirrorless, 4K, log, gimbals	Commercial quality even from a 1-person crew
2020–	Smartphone log, compact cinema cameras, wireless monitoring	Judgment gap over gear gap

What to read in the lineage

16mm made documentary, the DSLR made shallow-focus web video, the gimbal made the floating POV, and the smartphone made vertical short-form. The physical traits of gear shape visual language.

Exercise 3.1

Task Shoot the same scene on two of film · camcorder · DSLR · smartphone and compare their image characteristics.

Tip Match exposure and white balance as closely as you can before comparing, or the device differences won't show.

Assessment Controlled conditions, specific observations

Model answer Evaluates dynamic range, noise and color reproduction item by item.

PART 03 Camera gear and technique

3.2 Camera types and how to choose

Choosing a camera comes down to three questions: does the shot move, is light short, and will it be enlarged heavily in post.

Type	Strengths	Weaknesses	Best for	Rough entry cost
Cinema camera	Wide latitude, built-in ND, robust codecs	Heavy; needs accessories	Main ad shoots, drama	Very high
Mirrorless	Value, 10-bit log, 4K 60p	Overheating, recording time limits	Student projects, most commercial web video	Medium
Smartphone	Always at hand, macro, instant upload	Weak in low light, optical limits	Short-form, everyday life, 1st-person	Low
Action cam	Ultra-wide, strong stabilization, waterproof	Weak image quality, low light	Speed, mounted POV, risky spots	Low
Drone	Aerial view, shows scale	Permits, weather limits	One opening/ending shot	Medium
Built-in gimbal	Tracking shots on your own	Small sensor, fixed lens	Moving shots for 1-person crews	Low–medium
Broadcast camcorder	Long recording, optical zoom, audio inputs	Hard to go shallow	Events, lectures, live coverage	Medium

TIP

Don't pick 'the best specs'; pick 'specs enough for the result'.

Three deciding questions

01 Does the shot move — if so, you need stabilizing gear.

02 Is light short — if it's dark, you need a large sensor.

03 Will it be enlarged a lot in post — if so, you need high resolution.

Exercise 3.2

Task Propose camera packages, with budgets, for 3 hypothetical jobs (YouTube interview, brand film, music video).

Tip Look up rental rates and work out the cost per day.

Assessment Sound rationale (image quality, mobility, budget)

Model answer Picks not 'the best specs' but 'specs enough for the result'.

PART 03 Camera gear and technique

3.3 Sensor size and angle of view

The smaller the sensor, the narrower the same lens sees; the larger the sensor, the shallower the depth of field. The crop factor puts this difference into a number.

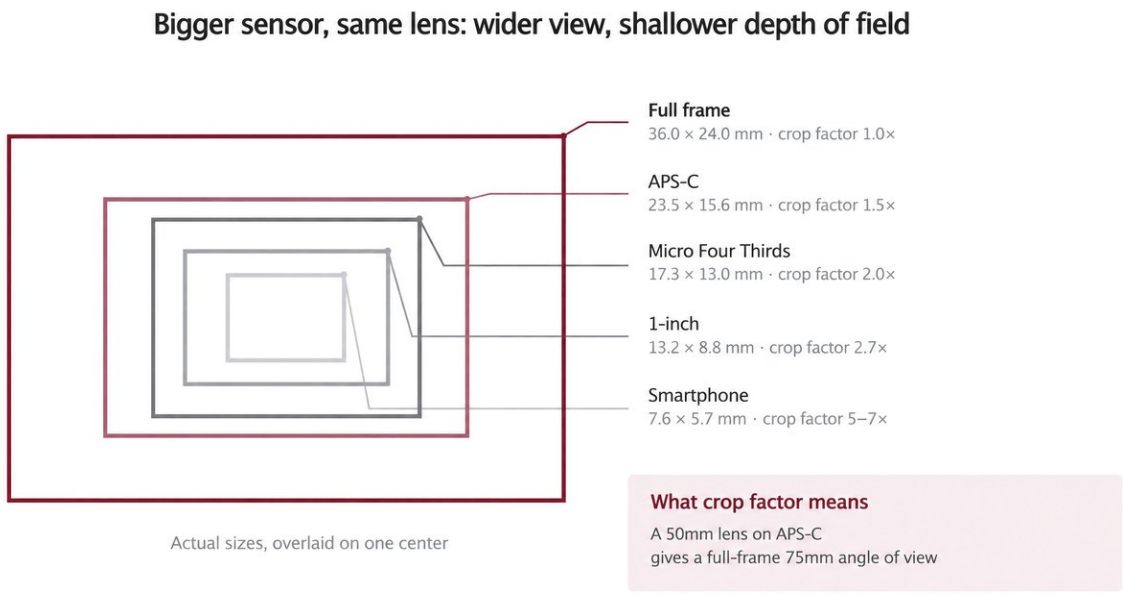

Figure 28 Sensor sizes compared

Sensor	Approx. size	Crop factor	Traits
Full frame	36 x 24mm	1.0x	Shallow depth of field, good low light, pricey
Super 35	Approx. 24.9 x 18.7mm	1.4x	Cinema standard, rich lens ecosystem
APS-C	Approx. 23.5 x 15.6mm	1.5–1.6x	Value, good for tele, entry-level mainstream
Micro Four Thirds	17.3 x 13mm	2.0x	Small and light, deep depth of field, easy on gimbals
1-inch	13.2 x 8.8mm	2.7x	Drones and compact cameras
Smartphone	Approx. 1/1.3-inch or smaller	5–7x	Good for macro and wide, weak in low light

Crop factor

A 50mm on APS-C gives the angle of view of a 75mm on full frame. To fit a full body into a tight space, the smaller the sensor, the wider the lens you need.

A multiplier showing how much narrower a lens of the same focal length sees than on full frame.

The larger the sensor, the shallower the depth of field. A large sensor helps when you want a blurred background, but holding focus gets harder too. When everything must be sharp, as in product ads, a small sensor is actually easier.

Note A full-frame sensor — the 'starting point of angle of view' you see with the lens off

Exercise 3.3

Task	From the same position, shoot on full frame and on a crop sensor (or smartphone zoom levels) and record the difference in angle of view.
Tip	Calculate the equivalent focal lengths yourself and write them down.
Assessment	Accurate crop-factor calculations
Model answer	Sums up not only angle of view but also differences in depth of field and noise.

PART 03 Camera gear and technique

3.4 The psychology of lenses and focal length

Focal length changes not just the angle of view but how close the audience feels to a character. Choosing a lens is choosing where to put the camera.

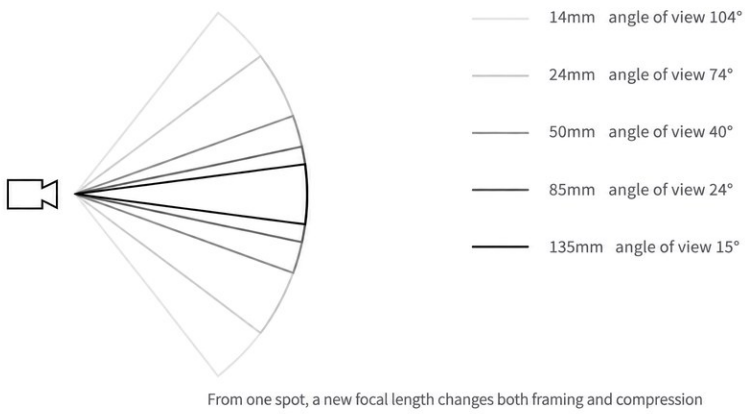

Figure 29 Angle of view by focal length

Reference photos 3.4A Generated image — directing reference

a
24mm — expanded space and distortion

b
50mm — natural perspective

c
135mm — compressed background and isolation

d
300mm — extreme compression, the distant observer

Focal length	Angle of view	Distortion	Psychological effect	Typical use
14–24mm	Ultra-wide	High	Exaggeration, expanded space, unease	Introducing a space, dynamic inserts
28–35mm	Wide	Slight	Sense of presence, observer's POV	Documentary style, everyday scenes, vlogs
50mm	Normal	Almost none	Natural, neutral	Default for people, dialogue
85mm	Short tele	None	Intimacy, beauty	Close-ups of people, beauty
100mm macro	Macro	None	Materiality, touch	Product texture, liquids, powders
135–200mm	Telephoto	Compression	Isolation, focus, distance	Emotion, compressed background

TIP

The longer the focal length, the farther back you must go. Record the distance.

Specialty lenses

Anamorphic

2.39:1 cinema look

- Squeezed horizontally, then unsqueezed
- Oval bokeh, horizontal flares

Probe lens

Passes through tight spaces

- Long, thin barrel
- Entry shots in drink, food and miniature ads

Tilt-shift

Tilts the focal plane

- Miniature effect
- Architectural verticals

Split diopter

Focus at two distances at once

- Close focus on part of frame
- Product in front and person behind, both sharp

Vintage lens

Retro texture

- Low contrast, soft flares
- Mostly manual focus

G-06 How focal length changes the face and background — 16 · 35 · 85 · 200mm

Exercise
3.4

Task	Keeping the face the same size, shoot at 16 · 35 · 85 · 135mm.
Tip	The longer the focal length, the farther back you must go. Record the distance.
Assessment	Perspective distortion and compression observed
Model answer	Records how the character seems to change at each focal length, down to audience reactions.

PART 03 Camera gear and technique

3.5 The exposure triangle

There are only three ways to set image brightness, and each has its own price. The decisive difference from photography is that in video you can't use the shutter freely.

Same brightness, different picture — change one of the three and pay it back with another

Opened the aperture

`f/1.8 · 1/1000 · ISO 100`

The background blurs — the price of shallow depth of field

Raised the ISO

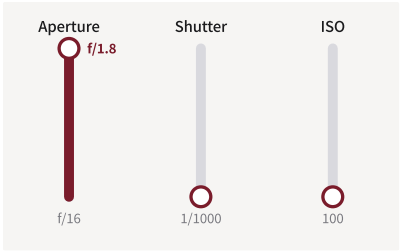
`f/16 · 1/1000 · ISO 6400`

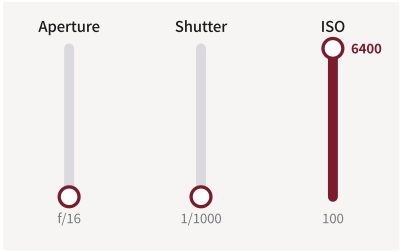
Noise in the shadows — the price of sensitivity

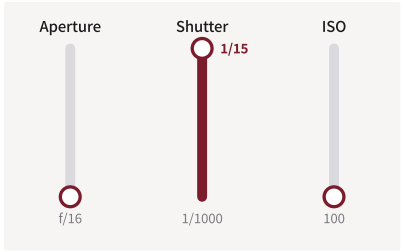
Slowed the shutter

`f/16 · 1/15 · ISO 100`

The water streams — the price of time







All three are equally bright. The light is the same, but where the price was paid differs — the **aperture** in depth of field, the **shutter** in blur, the **ISO** in noise. Open one up twofold and close another down by half (1 stop).

Figure 30 The exposure triangle — same scene, same brightness, three different choices. The sliders show which value was pushed to the limit.

The smaller the f-number, the thinner the sharp zone

f/1.4 · shallow depth of field

Only the person remains; the background melts — focus · emotion · beauty

f/4 · medium depth of field

Person crisp, background as mood — the interview · drama default

f/11 · deep depth of field

Sharp front to back — landscapes · whole products · information

Four ways to make depth of field shallow

- Open the aperture f/1.4
- Go longer 85→200mm
- Move closer to the subject
- Put the background farther away

Figure 31 Depth of field by aperture — same spot, same person, only the aperture changed. Depth of field is a directing decision about "how much to keep sharp."

Aperture (F-number)

The dial that sets the look

- Lower number: brighter, blurrier background
- F1.4, 2, 2.8, 4, 5.6, 8 — each step halves the light
- Most direct expression of intent

Shutter speed

Fixed in video

- Time spent recording one frame
- Tied to the 180-degree shutter rule; never use it to adjust exposure

ISO

Base ISO first

- Raising it brightens but adds noise
- Each model has a base ISO with the least noise
- Many models have dual base ISO

ND filter

The fourth dial

- Optical filter that only cuts light
- Essential for shooting wide open in daylight

ND8 3 stops
Overcast days, indoors by a window

ND64 6 stops
Wide open on sunny days

ND1000 10 stops
Long-exposure effects in daylight

TIP

Follow this order and your judgment holds on any camera.

Working order for video exposure

01 Lock the shutter
Twice the frame rate

02 Lock the ISO
The model's base ISO

03 Direct with aperture
Decide depth of field

04 Leftover brightness
Fix with ND and lighting

> In video, treat the shutter as a fixed value.
>
> 3.5 The exposure triangle

Tools for checking exposure

Tool	What it shows	Working standard
Histogram	Brightness distribution	Check nothing is clipped against either end
Waveform	Brightness by horizontal position	Keep skin tones around 55–70 IRE
Zebras	Areas above a set level	Set to 95–100% to watch for blown highlights
False color	Shows brightness as color	Most accurate for watching skin and highlights at once
Light meter	Incident light level	Meter each source separately when lighting

Reference photos 3.5A Generated image — directing reference

a F1.4 — shallow depth of field

b F8 — deep depth of field

c High ISO — noise

G-07 The exposure triangle — traces left by aperture · shutter · ISO

Note Exposure tools — false color · waveform · zebras are more accurate than the eye

Exercise 3.5

Task	Keeping the same brightness, shoot with three different aperture · shutter · ISO combinations.
Tip	When you raise one value by a stop, lower another by a stop.
Assessment	Accurate stop math; side effects of each combination (depth of field, blur, noise) observed
Model answer	Puts the results in a table to prove 'same exposure, different image'.

PART 03 Camera gear and technique

3.6 Units of illuminance and light

Describe light only as bright or dark and things will go wrong on set. Speaking in numbers lets you reproduce someone else's lighting setup.

100,000 lux
Outdoors at noon on a sunny day — ND essential

300–500 lux
Typical office — fill light recommended

10 lux
Around a candle — high ISO or lights essential

Unit	Meaning	Where it's used	Reference points
Lux (lux)	Light reaching a surface (illuminance)	Measuring light on set	Sunny outdoors 100,000, overcast 10,000
Lumen (lm)	Total luminous flux a source emits	Comparing light specs	Household bulb about 800lm
Candela (cd)	Luminous intensity in one direction	Spotlight specs	-
Nit (cd/m2)	Screen surface brightness	Monitors and LED signage	Indoor 500–1500, outdoor 5000 or more
Stop (EV)	Doubling steps of light	The common language of exposure	1 stop is 2x the light
Kelvin (K)	Color temperature	White balance	Candle 1800K, daylight 5600K
CRI / TLCI	Color rendering index	Fixture quality	95 or higher for filming

TIP

Always measure at the subject's face height.

Situation	Approx. illuminance	Difficulty
Outdoors at noon, sunny	About 100,000 lux	ND essential
Outdoors, overcast	About 10,000 lux	Easy
By a window, daytime	About 1,000 lux	Moderate
Typical office	About 300–500 lux	Fill light recommended

Situation	Approx. illuminance	Difficulty
Living room at night	About 100–150 lux	Lights needed
Around a candle	About 10 lux	High ISO or lights essential
Full moon, outdoors	About 0.25 lux	Special gear needed

Exercise 3.6

Task With a light meter app, measure the lux in a classroom, a hallway, outdoor shade and direct sun, and make a table.

Tip Keep the measuring position (subject's face height) the same.

Assessment Consistent measuring method, link to camera settings

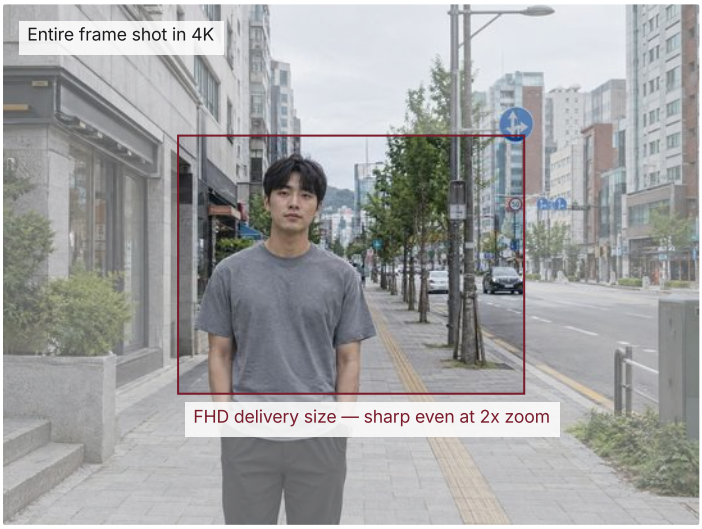
Model answer Notes the recommended ISO and whether extra lighting is needed for each reading.

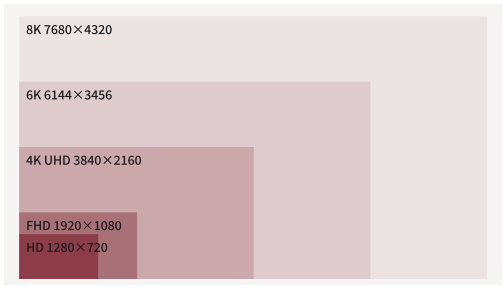
PART 03 Camera gear and technique

3.7 Resolution standards and aspect ratio

Shoot in 4K even if final delivery is FHD. Spare pixels are editing freedom, and aspect ratio changes the mood in which the audience takes in a scene.

Resolution is "how many dots you draw with"





Resolution = horizontal × vertical dots

4K is 4 times FHD — 2x across × 2x down

On the same monitor 4K is denser; at the same dot count, the bigger the screen, the coarser it looks

Shoot 4K even if the final is FHD — spare pixels become freedom to crop · zoom · stabilize in the edit

Figure 32 Resolution standards — FHD inside a 4K frame. The red box is the size of one FHD frame, and in the 4K original it can be moved anywhere.

Aspect ratio — width divided by height

4:3
1.33 · retro TV · flashbacks

16:9
1.78 · YouTube · TV · default

21:9
2.39 · cinema · letterbox

1:1
Feeds · thumbnails

9:16
Short-form · vertical LED

Aspect ratio is "width divided by height." Change the ratio and the same scene gives the person a different size and the background a different share — shoot in the delivery ratio from the start.

Figure 33 Main aspect ratios — the same scene cut to five ratios. Horizontal formats show space; vertical formats show people.

Name	W x H	Total pixels	Working use	Caveats
HD (720p)	1280 x 720	About 0.92M	Low-bandwidth web, old devices	Unfit for main use today
FHD (1080p)	1920 x 1080	About 2.07M	Web drafts, low-spec delivery	No room to crop in
2.7K	2704 x 1520	About 4.11M	Action cams, B-cameras	Weak as a main camera
UHD 4K	3840 x 2160	About 8.29M	Shooting standard	4x the storage
DCI 4K	4096 x 2160	About 8.85M	Cinema screens	Wider left to right
6K	6144 x 3456	About 21.24M	Room to crop	Needs a powerful edit rig
8K UHD	7680 x 4320	About 33.18M	Large LED, exhibitions	Render times soar

Why 4K is the default

Spare pixels for reframing, stabilization, punch-in inserts and vertical versions are editing freedom. To pull vertical short-form from horizontal footage, 4K is all but essential.

Note

A 21:9 crop throws away vertical pixels. Put a 2.39:1 guide in the viewfinder and keep boom mics and lights out of the area that will be cropped.

Aspect ratio	Value	Typical media	Mood and use
4:3	1.33:1	Analog TV, retro inserts	Retrospective, docs, archives
16:9	1.78:1	Broadcast, YouTube, web standard	Most versatile, safe
1.85:1	1.85:1	Feature films	Cinematic default
21:9	2.35–2.39:1	CinemaScope, brand films	Vastness, premium feel
1:1	1.0:1	Square feeds	Balance, strong symmetry
4:5	0.8:1	Instagram feed	Maximum vertical coverage
9:16	0.56:1	Shorts, Reels, TikTok	Full-screen immersion, close-ups

Cropping 16:9 top and bottom to get 21:9 is not the same as capturing true optical information with an anamorphic lens. The crop method assumes you shoot in 4K.

Exercise 3.7

Task	Compose the same scene in four aspect ratios: 16:9, 9:16, 1:1, and 2.39:1.
Tip	When the aspect ratio changes, subject placement and negative space must be redesigned too.
Assessment	Recomposing for each aspect ratio
Model answer	Mark the 'information lost' and 'space gained' for each ratio.

PART 03 Cameras and shooting technique

3.8 Frame rate and shutter angle

How many frames you split a second into sets the texture of motion; the shutter angle sets the motion blur. At 180°, the shutter speed is always double the frame rate.

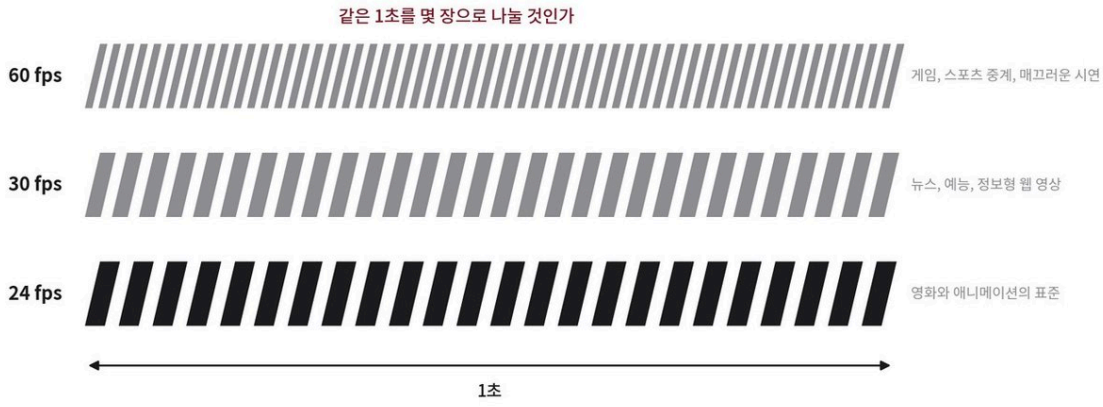


Figure 34 Frame rates compared — how many frames per second

Shutter angle — the share of each frame the shutter stays open

45° 1/192 s
Choppy crispness — combat · explosions · heightened urgency

180° 1/48 s
Natural motion blur — the cinema default

360° 1/24 s
Long, smeared trails — dreams · drunkenness · flashbacks

Shutter angle is the angle over which the rotary shutter is open. Light enters for that share of each frame (1/24 s), and motion blurs by the same amount. **Rule: shutter speed = 1 ÷ (fps × 2)** → 1/48 at 24fps, 1/120 at 60fps. In video the shutter sets not brightness but **the amount of motion blur** — set brightness with ND filters.

Figure 35

Shutter angle and motion blur (at 24fps) — the red part of each circle is the time the shutter is open. The wider the angle, the longer the motion captured in one frame.

24 fps
Cinematic blur — default for emotional ads, shutter 1/48

30 fps
Crisp and informational — caption-heavy ads

60 fps
Product demos, 2× slow — shutter 1/120

120 fps
Product macro, 5× slow — shutter 1/240

Frame rate	Feel of motion	Main uses	In ads
24 fps	Cinematic blur, emotional	Features, brand films	Default for emotional ads
25 fps	European broadcast standard	PAL-region broadcast	Check for overseas delivery
30 fps	Crisp, informational	Broadcast, web ads	Informational, caption-heavy
60 fps	Smooth, realistic	Sports, games, demos	Product demos, 2× slow
120 fps	Ultra-slow, tactile	Product macro, liquids	5× slow inserts
240 fps and up	Extreme slow motion	Impacts, bursts, sprays	1–2 accent cuts

Slow-motion formula

Shooting fps divided by timeline fps is the slow-down factor. 120fps footage on a 24fps timeline plays 5× slow. But 120fps needs about 5× the light of 24fps, so trying it without a lighting plan ends in noise.

Note

To keep the 180-degree rule outdoors in daylight, you need ND filters. Stop down instead and you lose the background blur you intended.

Shutter angle and the 180-degree rule

Shutter angle	Shutter speed (24fps)	Motion blur	Intended effect
45°	1/192 s	Very low	Urgency, impact
90°	1/96 s	Low	Crisp action, sports
180°	1/48 s	Standard	Natural default

Shutter angle	Shutter speed (24fps)	Motion blur	Intended effect
270°	1/32 s	High	Dreamy, drunk, flashback
360°	1/24 s	Very high	Dreams, hallucination, distortion

Reference photos 3.8A Generated images — directing reference

a 360° shutter — long blur

b 45° shutter — choppy crispness

c High-speed shooting — frozen droplets

G-08 Shutter speed and motion — 180° shutter vs. fast shutter

Exercise
3.8

Task Shoot the same action at 24fps (1/50), 60fps (1/120), and 120fps, and compare the slow motion and the texture of movement.

Tip As a baseline, set the shutter denominator to double the frame rate.

Assessment Grasp of the 180° shutter; apt use of slow motion

Model answer Use slow motion only at the emotional peak, to stretch time.

PART 03 Cameras and shooting technique

3.9 Color temperature and white balance

White paper records as white when the camera setting matches the light's color temperature. Whether a mismatch is a mistake or a choice must be settled in pre-production.

Light has color — read it in kelvin (K)

Warm — orange · lower number

Cool — blue · higher number

1,900K
Candle

3,200K
Tungsten · incandescent

4,200K
Fluorescent

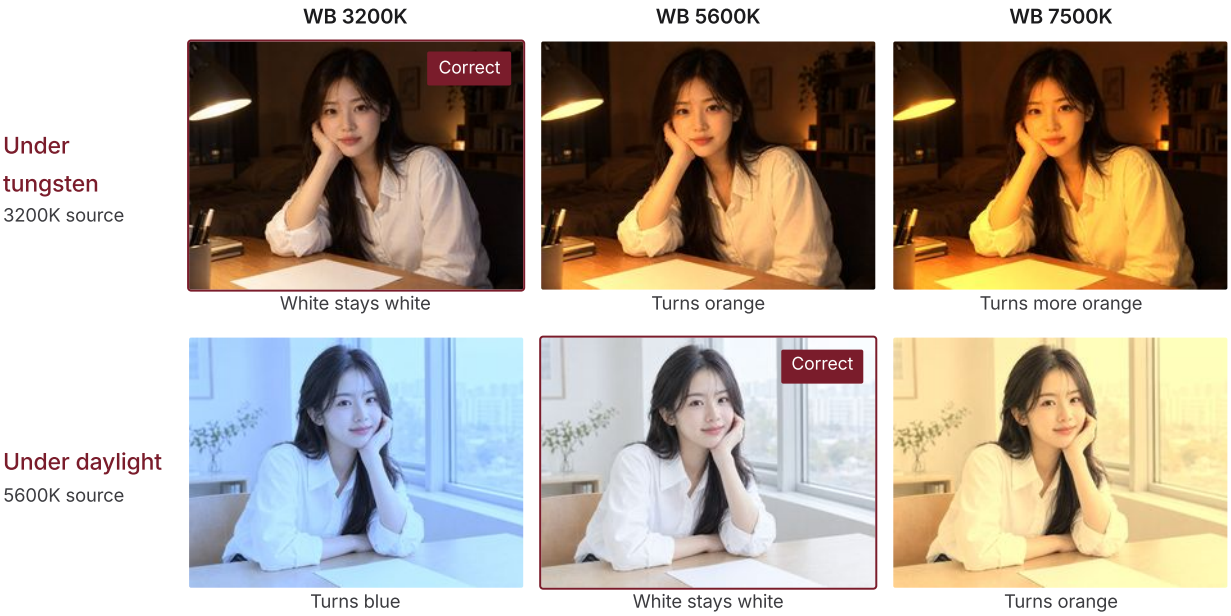
5,600K
Midday sun · daylight LED

6,500K
Overcast

8,000K
Shade · blue skylight

Figure 36 Color temperature by source — even "white light" differs in color from source to source. Lower numbers are redder, higher ones bluer.

White shoots white only when the camera matches the light



Set the camera WB **below the source and it shoots blue**; **above, and it shoots orange**. Use the mismatch on purpose — the blue of dawn, the warmth of night. But within one scene, always stick to a single value.

Figure 37 White balance — white paper shoots white only when the camera setting matches the source's color temperature. The same photo with only the WB value changed.

Reference photos 3.9A Generated images — directing reference

a WB set to 3200K under daylight — blue

b WB set to 5600K under daylight — normal

c WB set to 7500K under daylight — yellowish

Set the camera below the source and the image leans blue; above, and it leans orange. Turn this around and you can set 3200K under daylight to create the cold mood of dawn or night on purpose.

Light source	Color temperature	On-screen impression
Candle	About 1800K	Very warm, orange
Incandescent	About 2800–3200K	Warm, indoor mood
Tungsten light	3200K	Standard indoor light
Fluorescent	About 4000–5000K	Watch for a green cast
Daylight	5600K	Outdoor standard
Overcast	About 6500K	Bluish tint
Shade, blue sky	7500K and up	Cold, dawn feel

TIP

Turn off auto white balance and enter the kelvin value yourself.

Rules on set

- Auto white balance shifts color from cut to cut, so the shots won't cut together. Always lock it manually.
- On mixed-light locations, gel the windows or swap the interior lights so every source is one color.
- Setting a custom white balance off a gray or white card makes color correction in post easier.
- Decide deliberate color shifts on set, not in post. Even in log, set a reference before you shoot.

Reference photos 3.9B Generated images — directing reference

a Mixed light — window daylight and indoor tungsten

b Setting a reference with a gray card

c Deliberate color shift — the blue of dawn

Color space

Color space	Gamut	Main use	Note
Rec.709	Narrow	Broadcast, web standard	Basis for most final deliveries
sRGB	Similar to Rec.709	Web graphics	Check when mixing video and graphics
DCI-P3	Medium	Cinema, latest phones	Needs a separate SDR version
Rec.2020	Very wide	8K, HDR	Limited playback support

G-09 White balance — one scene, four color temperature settings

Exercise 3.9

Task Under incandescent, fluorescent, and window light, white-balance off a sheet of white paper and record the process.

Tip Turn off auto white balance and enter the kelvin value yourself.

Assessment Accuracy of kelvin choices; handling of mixed light

Model answer Add a cut that deliberately skews color temperature to create emotion (cold, warm).

PART 03 Cameras and shooting technique

3.10 Codecs · bit depth · log

Choose a different codec for each stage; shoot 10-bit if you'll grade and 4:2:2 or better if you'll composite. Log buys latitude in post and pays for it in exposure margin.

Codec	Character	File size	Best stage	Remarks
H.264	Compressed for delivery	Very small	Final delivery, web upload	Poor as an edit source
H.265 (HEVC)	Efficient compression	Small	4K camera originals	Use proxies to edit
ProRes 422 HQ	Edit-friendly	Large	Standard for edit and comp	De facto industry standard
ProRes 4444	Supports alpha channel	Very large	Motion graphics intermediates	Advised for AE renders
DNxHR	ProRes alternative	Large	Windows editing	Avid-compatible
RAW	Raw sensor data	Huge	Top-tier ads	Needs separate processing

Bit depth

10-bit is the baseline

- 8-bit: 256 levels per channel, about 16.7 million colors
- 10-bit: 1024 levels per channel, over 1 billion colors
- 8-bit shows banding in skies and gradients
- The heavier the grade, the more you need 10-bit
- Shoot 10-bit even for student projects

Chroma subsampling

4:2:2 or better for chroma key

- 4:4:4 no color loss, ideal for compositing
- 4:2:2 half the color data, ad standard
- 4:2:0 1/4 of the color data, consumer codecs
- Keying 4:2:0 inevitably leaves jagged edges

Note

Log is not recommended for chroma key shoots. Its low contrast drains saturation from the green, and the key edges fall apart.

Log recording

Log compresses the wide brightness range the sensor captures. The image looks washed out and flat, but highlight and shadow detail survive, leaving lots of room in post. It is vulnerable to underexposure, though, so shooting slightly bright and pulling it down in post reduces noise.

Put a look LUT on the set monitor so people can picture the result, but always record the original log.

> Shoot slightly bright and pull it down in post.
>
> 3.10 Log recording

Log workflow

01 Shoot log

02 Make proxies

03 Rough cut

04 Technical LUT conversion

05 Primary correction

06 Composite matching

07 Final grade

Containers are not codecs

Term

The **container** is the vessel (MP4 · MOV), the **codec** is how the contents are compressed (H.264 · ProRes), and the **bitrate** is the data per second (Mbps). Two .mp4 files can hold different codecs.

Type	Name	Used for	Strengths	Note
Container	MP4	Delivery · web · social standard	Best compatibility, small files	Heavily compressed for editing (long-GOP)
Container	MOV	Originals · editing · delivery (broadcast)	Holds high-quality codecs like ProRes	Large; check Windows compatibility
Container	AVI	Old Windows · some devices	Simple	Thin metadata; rarely used today
Container	MXF	Broadcast · cinema camera originals	Rich timecode · metadata	Won't play in ordinary players
Container	MKV · WebM	Web · archive	Subtitles · multiple tracks	Limited editing software support
Codec	H.264 (AVC)	Shooting (XAVC-S) · delivery	Plays anywhere	Mostly 8bit 4:2:0 → little grading room
Codec	HEVC (H.265)	4K · 10bit shooting (XAVC-HS) · streaming	Half the size at the same quality	Heavy to edit → proxies
Codec	ProRes · DNxHR	Editing · masters · delivery (broadcast)	Frame-by-frame compression, light to edit	10–20× the file size
Codec	AV1	YouTube · Netflix server side	Next-gen efficiency	Creators rarely encode it themselves

TIP

One rule:

shoot the best, edit the lightest (proxies), deliver what the client specifies.

With no spec, MP4 / H.264 / 1080p / 20–30Mbps.

Exercise 3.10

Task	Shoot the same scene with a standard profile and a log profile, and compare them before and after grading.
Tip	Log is often exposed about 1 stop bright. Check your camera's recommended value.
Assessment	Grasp of bit depth · codecs; verifying grading latitude
Model answer	Prove the dynamic range difference with a back-lit scene that has both sky and shade.

PART 03 Cameras and shooting technique

3.11 Camera support and movement

Equip in the order tripod → slider → gimbal and you can cover almost every cut of a 15-second ad. A tripod with lighting always beats a gimbal without it.

Reference photos 3.11A Generated images — directing reference

a

Tripod and fluid head

b

Slider

c

3-axis gimbal

d

360 camera — two fisheye lenses capture every direction at once; framing happens in the edit

Tripod

The most important gear

- Smooth pans · tilts need a ball leveler and fluid head
- Essential for compositing plates

Slider

Short, precise horizontal moves

- Standard gear for product ads
- Best value for money

Gimbal

3-axis stabilization

- Get tracking shots solo
- Balance and calibration decide the result

Dolly and track

Long straight moves

- Sense of space and weight
- Long setup time

Crane, jib

Big vertical moves

- Showing off scale
- Saved for the final shot

Drone

Aerial viewpoint

- Flight approval and safety checks come before shooting

TIP

With a gimbal, walk the bent-knee 'ninja walk' to reduce vertical bounce.

Priorities for students and solo creators

01

Tripod

Locked-off shots and compositing plates

02

Slider

Precise horizontal moves on products

03

Gimbal

Tracking shots

> A lit tripod always beats an unlit gimbal.
>
> 3.11 Camera support and movement

G-10 Camera support — tripod · slider · gimbal · shoulder rig · drone

Choosing a tripod

Reference photos 3.11B Generated images — camera support

Note

Fluid-head tripod — pan · tilt resistance (drag) is what makes it a video tripod

Note

Gimbal — the standard for walking shots. Balance first, motors second

For video

Fluid-head tripod

- Fluid drag on pan · tilt → smooth starts · stops
- Ball level (leveling half-ball) is a must
- Rated for 1.5× the load or more (camera+lens+monitor)

For photo · travel

Ball-head tripod

- Light and quick, but pans are rough
- For locked-off shots · time-lapses · interview B-cam
- Center column is a last resort

Mobile

Monopod · mini · flexible

- Monopod: telephoto · sports · tight spaces
- Mini (tabletop) tripod: products · vlogs
- Gorilla-type: wraps around railings · branches

01 Level it first. A pan that isn't level can't be fixed in post.

02 Extend the thick leg sections first; don't raise the center column (the main cause of shake).

03 Hang a sandbag or bag to lower the center of gravity. A must on windy rooftops.

04 Match pan drag to the shot — high for slow pans, low for tracking pans.

05 Use a remote trigger or 2-second timer to remove shake from pressing the shutter.

360 · wearable cameras

Reference photos 3.11C Generated images — hands-free cameras

Note

360 camera + invisible selfie stick — choose the angle after you shoot

Note

Wearable camera — first-person view from a cap brim · necklace · magnetic clip

360 cameras

Insta360 X series · DJI Osmo 360 · GoPro 360

- Two fisheyes record every direction; reframe to pull out 16:9 · 9:16
- The 'invisible selfie stick' hides in the blind spot between the two lenses
- 8K-class 360 ≈ 2.7K flat after extraction

Wearable · ultra-compact

Insta360 GO series · action cams

- Thumb-sized; mounts on a cap brim · collar · necklace by magnet · clip
- First-person cooking · crafts · field records; child · pet POV
- Horizon leveling · stabilization are the key features

Built-in gimbal

DJI Osmo Pocket series

- Pocket camera with a built-in 3-axis gimbal; the walking-vlog standard
- Face tracking (ActiveTrack) · switch to vertical
- Models that link directly to mic receivers suit solo work

NOTE

For 360, use a thin-legged monopod-style stand (it vanishes at the nadir). Plan 360 footage on the equirectangular board in PART 02; editing is all reframing (moving the view with keyframes). Product names · generations as of writing.

Exercise 3.11

Task	Shoot the same move on a tripod, slider, gimbal, and handheld, and compare how each feels.
Tip	With a gimbal, walk the bent-knee 'ninja walk' to reduce vertical bounce.
Assessment	Stability of each rig; reasons for the choice
Model answer	Separate scenes that use handheld unease on purpose from scenes that use gimbal smoothness.

PART 03 Cameras and shooting technique

3.12 Mirrorless setup in practice

Menu names change with every generation, but the order of operations stays the same. Drill the sequence below and you can set up any model in under 5 minutes.

TIP

Check resolution, frame rate, shutter, picture profile, audio levels, and focus mode, in that order.

01 Switch to movie manual mode. In auto, exposure shifts from cut to cut and won't match in the edit.

02 Set the recording format and frame rate first. Choose 4K 24p or 4K 60p to suit the final use.

03 Set the picture profile. Log if you'll grade in post, standard if you'll deliver straight away.

04 Lock the shutter at double the frame rate. At 24p, 1/48 or 1/50.

05 Lock ISO at base ISO. Log profiles often have a higher base ISO.

06 Set white balance manually or measure a custom value.

07 Decide depth of field with the aperture, and add an ND filter if it's too bright.

08 Focus depends on the situation. Face-detection AF for a lone person; manual focus for products and compositing plates.

09 Check with zebras or the histogram that highlights aren't clipping.

10 Set audio levels manually and monitor on headphones.

11 Check card space and battery level, then shoot a test and play it back.

Setting presets by situation

Situation	Resolution/fps	Shutter	Aperture	ISO	Profile
Emotional portrait	4K 24p	1/48	F2.0–F2.8	Base ISO	Log + look LUT
Product slider	4K 60p	1/120	F5.6–F8	Base ISO	Log
Product macro	4K 120p	1/240	F8–F11	1 stop up	Log
Chroma key	4K 30p	1/60	F4–F5.6	Lowest base	Standard profile
Outdoor, moving	4K 60p	1/120	F4	Base ISO	Log + ND
Vertical short-form	4K vertical 30p	1/60	F2.8	Base ISO	Standard

Reading the mode dial — P · S · A · M

Note Mode dial — for video, M (or A) + auto ISO. The exposure compensation dial fine-tunes brightness in A mode

Mode	Name	Camera sets / you set	When, in video
AUTO	Full auto	Camera sets everything	Don't — exposure · color jump every cut
P	Program	Camera: aperture · shutter; you: the rest	For quick grabs. The shutter ignores the 180° rule
S (Tv)	Shutter priority	You: shutter / camera: aperture	When outdoor light keeps changing; shutter locked at 1/50
A (Av)	Aperture priority	You: aperture / camera: shutter	Default for stills; not for video, as the shutter drifts
M	Manual	You: aperture · shutter; ISO can be auto	**The video default.** Shutter 1/50 · fixed aperture · auto ISO (cap 6400)
MR (1 · 2 · 3)	Memory recall	Recalls saved settings	Save 'interview' 'outdoor' 'slow' sets for a 1-minute setup
S&Q	Slow & quick	Separates capture fps from playback fps	120fps capture → 24p playback = 5× slow (no sound)

Recommended settings by situation (α7 series)

Situation	fps	Shutter	Aperture	ISO	WB	Picture profile	Memo
Indoor interview	24p/30p	1/50 · 1/60	f/2.8–4	800	Match the key light (5600K)	S-Cinetone	Turn off fluorescents; check for flicker
Outdoor daytime vlog	30p	1/60	f/2.8–5.6	100–400	Locked at 5600K	S-Cinetone · HLG3	Hold the shutter with ND
City at night	24p	1/50	f/1.4–2	3200–12800	3200–4000K	S-Log3	Use dual base ISO (S-Log3: 800/12800)
Product tabletop	24p	1/50	f/5.6–8	100–400	Match the lights	S-Cinetone	Tripod · manual focus · focus magnifier

Situation	fps	Shutter	Aperture	ISO	WB	Picture profile	Memo
Slow motion	120p(S&Q)	1/250	f/2–2.8	400–1600	Locked	S-Log3	Needs 4× the light; no sound recorded
Chroma key	24p/30p	1/50	f/4	400–800	5600K	S-Log3 4:2:2 10bit	Expose background and subject separately; don't speed up the shutter

TIP

180-degree rule: shutter = 1 ÷ (fps × 2). 24p → 1/50, 30p → 1/60, 60p → 1/125, 120p → 1/250. If it's too bright, adjust ND, not ISO.

Three lenses do it all — 55 · 85 · 200

Three lenses do it all — 55 · 85 · 200

55 mm — distance as the eye sees it

Interviews · products · vlogs. No distortion, fast and light. If you buy only one, this

85 mm — the most flattering distance for faces

Close-ups · beauty. The background blurs heavily and the face flattens neatly. In a small room you need space to back up

200 mm — pulls in from far away

Stage · sports · documentary observation. The background compresses and looks pressed close. Shake is high, so tripod · monopod

Note

55 · 85 · 200 for full-frame mirrorless — the bigger the number (focal length), the narrower the angle of view and the farther you stand from the subject. Choosing a lens means choosing "how many m to put between the audience and the person."

55mm · standard

Distance as the human eye sees it

- Interview bust shots · product tabletop · vlogs
- No distortion · fast f/1.8 · light and cheap
- If you buy only one, this

85mm · short telephoto

The most flattering distance for faces

- Close-ups · beauty · product detail
- The background blurs heavily and the face flattens neatly
- In a small room you need space to back up (min. 0.8 m)

200mm · telephoto

Pulls in from far away

- Stage · sports · documentary observation
- The background compresses and looks pressed close
- High shake → 1/250 or faster · tripod · monopod

Focal length (full frame)	APS-C equivalent	Look	Common shots
24mm	16mm	Wide, exaggerated perspective; shows the space	ELS · LS · vlog selfie
35mm	24mm	The documentary eye, natural width	FS · MS · walking
55mm	35mm	Human eye	MS · BS · interview

Focal length (full frame)	APS-C equivalent	Look	Common shots
85mm	55mm	Compresses the subject, separates the background	CU · beauty · product
200mm	135mm	Strong compression, observer's distance	ECU · sports · stage

Exercise
3.12

Task Make a pre-shoot settings checklist for a mirrorless camera and attach captures of the actual settings screens.

Tip Check resolution, frame rate, shutter, picture profile, audio levels, and focus mode, in that order.

Assessment Completeness of setup; fit with the shoot's purpose

Model answer Make separate setting presets for each shoot type (interview, sports, night).

PART 03 Cameras and shooting technique

3.13 Shooting with a smartphone

The smartphone is the most widely used camera. Know its limits and it can hold its own in commercial work. The key is not leaving it on auto.

Auto features you must turn off

Feature	Problem on auto	Manual fix
Auto exposure	Brightness swings whenever a cloud passes	Exposure lock or pro mode
Autofocus	Focus hunts mid-shot	Focus lock or manual focus
Auto white balance	Color varies by cut; can't be edited together	Set color temperature manually
Auto HDR	Flattens texture, less room in post	Use only when needed
Excessive stabilization	Jello effect: wobbling edges	Turn off on a gimbal

TIP

Long-press to lock exposure and focus (AE/AF lock).

Seven ways to raise quality

01 Stabilize. A tripod or mount alone gets you more than halfway there.

02 Get close. Digital zoom throws away quality. Zoom with your feet.

03 Find the light. Stand the person at a window, facing it, and you need no lights.

04 Wipe the lens. Pocket fingerprints lower contrast across the whole frame.

05 Record sound separately. Use an external mic or a separate recorder.

06 Shoot log or a flat profile. Recent models support log.

07 Shoot 4K to leave room for both vertical and horizontal versions.

When a smartphone is actually better

Tight spaces, first-person views, macro, everyday-life scenes, and situations where you mustn't look like you're filming. Point a big camera at people and they freeze, but they react naturally to a phone. Choosing a tool isn't only about image quality.

Note Smartphone rig — add a cage · mic · small light and it becomes a 'camera'

Exercise
3.13

Task	Using only a smartphone, shoot a 1-minute interview with proper lighting · audio · stabilization.
Tip	Long-press to lock exposure and focus (AE/AF lock). An external mic raises quality dramatically.
Assessment	Exposure · focus lock; voice clarity
Model answer	Use window light as the key and white paper as a reflector.

PART 03 Cameras and shooting technique

3.14 Filters and drone shooting

A filter is a choice post can't undo; with a drone, approval and safety come before shooting.

Video filters at a glance

Filter	Role	When to use	Note
ND filter	Cuts only the amount of light	Shooting wide open in daylight	Variable ND shows an X pattern at extreme settings
Polarizer (CPL)	Removes reflections, deepens skies	Glass, water, landscapes	Uneven sky on wide lenses; loses 1 stop or more
Black Pro-Mist	Highlights bloom softly	Portraits, night lights	Too much looks hazy
Streak	Horizontal light streaks	Anamorphic look	Tacky if overused
Diffusion	Softens contrast and sharpness	Skin, retro texture	Can't be undone in post
UV / protection	Protects the lens	Outdoors in general	Cheap ones degrade the image

Note

Drone laws and approval procedures change often. When planning, check the latest rules with the relevant authority yourself and build the approval lead time into the schedule.

Drone shooting in practice

01 Check where you may fly and whether approval is needed. Airspace over airports, military sites, and crowded areas is restricted.

02 Check pilot certification and drone registration requirements. They vary with the drone's weight.

03 Check the weather. Wind speed, rain, and sunrise and sunset times decide whether you can shoot.

04 At least 3 sets of batteries. Each set gives about 15 minutes of real shooting.

05 Before takeoff, check the compass and GPS signal and set the return-to-home altitude.

06 Do one simple move at a time. Pushing forward, rising, and rotating at once makes the image dizzying.

07 The most useful shots are a rising opener and a pull-back-and-rise ending. Get these two first.

08 Post one safety spotter to watch for people and obstacles nearby.

Note Variable ND — the only way to hold a 1/50 shutter on a bright day

Note Drone takeoff — this shot is legal only once approval · permit · insurance are all done

Drone filming approval process (Korea)

01	02	03	04	05	06
Aircraft · license	**Check the zone**	**Flight approval**	**Aerial filming permit**	**Special flight approval**	**On the day**
Register non-commercial drones over 2kg; register all commercial ones. Pilot certificates: Class 4 (250g–2kg, online training) to Class 1	On Drone One-Stop (drone.onestop.go.kr) · apps, check controlled airspace (9.3km around airports) · no-fly zones (e.g., P-73 over central Seoul) · the 150m altitude limit	Controlled airspace · no-fly zones · above 150m need approval from a regional aviation administration or the Ministry of National Defense (Capital Defense Command, etc.). Apply via Drone One-Stop, usually 3 days ahead	Under the Ministry of National Defense. Required in military protection zones and the like; easing elsewhere — always check the latest guidelines before applying	Night · beyond-visual-line-of-sight (BVLOS) flights need a separate special approval from the Korea Institute of Aviation Safety Technology	Insurance (mandatory for commercial) · weather (stop at winds of 10m/s or more) · battery temperature · notify people nearby · flight log

NOTE

Rules change — this reflects the time of writing; always reconfirm requirements · lead times · exemptions against Drone One-Stop notices and the Enforcement Rule of the Aviation Safety Act. A school campus inside controlled airspace needs approval too.

Six shots only a drone can get

ORBIT
Circle with the subject at the center — introducing landmarks · products · people

REVEAL
Rise from behind a ridge · building to unveil the view — openings

TOP-DOWN
Straight-down 90° overhead — patterns and graphics, scale

DRONIE
Pull back · up away from a person — "I am here"

FLY-THROUGH FPV
Pass through arches · windows · gaps — speed, first person

TRACK
Run alongside a moving car · person — chase, journey

> A drone is not a "tall tripod." You fly it for the six moves a ground camera can't make. **One** move per shot, at a constant speed, with a 2-second hold at the start and end.

Figure 38 Six camera moves unique to drones — orbit · reveal · top-down · dronie · fly-through · tracking.

Exercise
3.14

Task	Plan a backlit portrait using an ND filter and an opening shot from a drone (or a high vantage point).
Tip	With drones, always check no-fly zones and permit requirements first.
Assessment	Purpose of filter use; record of safety · legal checks
Model answer	Design the drone shot to show the scale of the place, then narrow in to the person.

PART 03 wrap-up

Exercises and review

01 F2.0 and F8

Shoot the same scene at both apertures, compare the background blur, and note what you adjusted to match exposure.

02 Auto WB and locked 5600K

Shoot 1 minute of each by an indoor window and see how the color shifts.

03 **24 · 60 · 120fps**

Shoot the same action, put it on a 24fps timeline, and compare the speeds.

04 **Your camera's base ISO**

Look up the base ISO and dual base ISO in the maker's documentation and record them.

One-page summary

3.2 Choosing a camera	If it moves, stabilization; if it's dark, a big sensor; if you'll crop in, high resolution.
3.3 Sensor and angle of view	50mm on APS-C is 75mm on full frame. The bigger the sensor, the shallower the depth of field.
3.4 The psychology of lenses	Perspective is changed by the camera's position, not the lens.
3.5 The exposure triangle	Lock the shutter, lock ISO at base, shape with the aperture, and handle leftover brightness with ND and lighting.
3.7 Resolution	Shoot 4K even if the final output is FHD. Spare pixels are editing freedom.
3.8 Shutter angle	A 180° shutter is double the frame rate: 1/120 at 60p, 1/240 at 120p. High frame rates demand proportionally more light.
3.9 White balance	Auto exposure and auto WB make cuts impossible to join. Always lock them manually.
3.10 Codecs and log	Chroma key edges hold up at 4:2:2 or better. This is the one shoot where log isn't advised.
3.11 Camera support	Tripod → slider → gimbal. A lit tripod beats an unlit gimbal.
3.13 Smartphones	Stabilize, get close, find the light, wipe the lens, record sound separately.

Questions to consider

Q Why shouldn't the shutter be used to control exposure in video?

The shutter is bound to the 180-degree rule and sets the texture of motion blur, so treat it as a fixed value.

Q What is the difference between ND8 and ND64 in stops?

ND8 cuts 3 stops, ND64 6 stops, and ND1000 10 stops.

Q Why is a 4:2:0 codec bad for chroma key?

With only 1/4 of the color data, keyed edges come out jagged.

Q Why shoot log slightly bright?

Log is vulnerable to underexposure, so shooting bright and pulling down in post reduces noise.

Q When must you shoot 4K for an FHD final output, and when not?

If you expect reframing, stabilization, or a vertical version, 4K is a must. Work out for yourself the cases where it isn't.

Field tips

- The day before the shoot, count cards and batteries and photograph them. It's your evidence when someone on set says something is missing.
- Check focus with magnification before the director checks the frame. A soft shot can only be fixed by a reshoot.
- When renting gear, photograph its condition on return. 90% of damage disputes end with that one photo.

MEMO · PART 03

PART 04

Lighting is not about brightening.
It is about placing the dark.

What you make in this PART

1. A portrait lit with a single key light
2. 2 posters: high-key · low-key
3. A clean recording with 30 seconds of room tone

Lighting and sound

How do light and sound move us? Lighting and sound are the two most underrated areas, yet they shape the result more than anything. A window, a white foam board, and a mic within 30 centimeters of the mouth make half the problems disappear. This PART covers not only how to add light but how to take it away.

Photo P-04 A gaffer setting up lights and a sound crew member with a boom mic · generative image

Using this chapter in class

Light a person with a single key light and record clean sound

Materials One LED light or a window, reflector, black flag, external mic

10 min	15 min	10 min	10 min	5 min
Intro	Concepts	Plates	Exercise	Wrap-up
Compare an unlit shot with a one-key-light shot	5 properties of light, 6 key-light principles, lighting ratio	Read shadow shapes from the 6 portrait-lighting pattern diagrams	Make Rembrandt and split lighting with one light; record 30 seconds of room tone	Safety rules and chroma key materials for the next session

Check point

Shadow direction and density controlled on purpose

PART 04

Introduction

Lighting and sound are the two most underrated areas, yet they shape the result more than anything. Viewers will sit through slightly soft footage to the end, but they leave muddy-sounding video within 3 seconds. An interview with a dark face reads as amateur work, however good the content.

Fortunately, in both areas understanding counts for more than money. A window and a white foam board solve half of portrait lighting, and bringing the mic to within 30 centimeters of the mouth removes most sound problems. Cheap gear up close always beats expensive gear far away.

This part covers not only how to add light but how to take it away. Half of low-key lighting is stealing light with black cloth, and half of good recording is switching off noise sources. Lighting design is not the craft of making things bright but of deciding where to leave dark.

Background 5

An aesthetic history of light — from chiaroscuro to natural light

The language of film lighting began on painters' canvases. In late-16th-century Italy, Caravaggio painted dramatic scenes by revealing only part of a figure in strong light against darkness. Such strong light-dark contrast is called chiaroscuro, and its extreme form tenebrism. In 17th-century Holland, Rembrandt loved portraits in which light from one side leaves a small triangle on the shadowed cheek, and on today's sets this lighting bears his name.

The 1920 German Expressionist film The Cabinet of Dr. Caligari treated light and dark as a language of the psyche, even painting shadows directly onto the sets. With the emigration of German filmmakers in the 1930s–40s, this aesthetic crossed to Hollywood and carried into film noir's low-key lighting and venetian-blind shadows falling like prison bars. In 1949, DP John Alton described lighting in Painting with Light as a means of expression rather than a technique.

At the same time, the studio system set the standard for making stars look beautiful. Three-point lighting — key, fill, and backlight — became the formula for separating a person from the background and reliably modeling the face, and it is still the basis of interview and commercial shoots. Italian Neorealism and the French New Wave, by contrast, took light cameras and fast film into the streets, shooting in natural light and choosing realism over artificial beauty.

Today's DPs build their own language between these two traditions. Vittorio Storaro gave color and light symbolic meaning, while Roger Deakins is known for a naturalism that designs light around sources that could plausibly exist in the scene, such as windows or lamps. Digital sensors and LED lights let us shoot with less light, but the principles that govern direction, quality, and contrast have not changed.

When learning lighting, remember that every light has a motivation. Where does this light come from? Why this direction? What does the audience feel from it? The lighting patterns and gear in chapter 4 are tools for answering these questions.

PART 04 Lighting and sound

4.1 Five properties of light

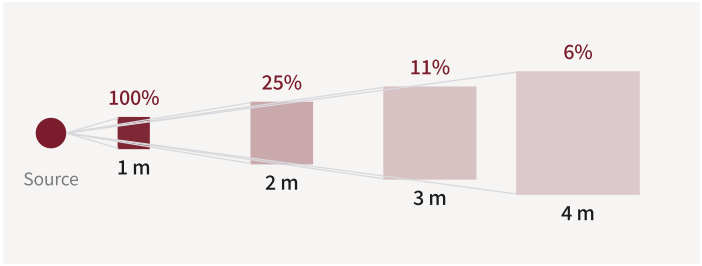
To work with light, you must first be able to name it in five words. Quality · direction · color · intensity · contrast, and movement.

Double the distance and light spreads over four times the area

Stage — under a spotlight
White underfoot, dark two steps away. If the actor strays half a step, the face goes dark

Night road — headlights
The first 10 m is bright, then the light drops away fast. Near light falls off steeply

Room — window light
Several stops between right by the window and deep in the room. Put the person by the window and the background goes dark



Double the distance → 1/4 the brightness

Because the same light covers four times the area

Near lights fall off steeply, far lights gently

Using it on set

Dark background: light close to the person (the background drops off fast)

Person and background alike: light far away, power up

Moving subject: light far away — a step or two won't make brightness jump

Figure 39 The inverse square law — double the distance and light spreads over four times the area, dimming to 1/4. The same law you can see on stages · roads · by windows.

Term

Hard light casts sharp-edged shadows; soft light casts gentle ones. The larger and closer the source, the softer the light.

Quality

Quality

- Hard: sharp and dramatic
- Soft: gentle and forgiving
- Larger, closer sources are softer

Direction

Direction

- Front · side · back · top · bottom
- Direction creates form
- Side light reveals texture best

Color

Color

- Color temperature and tint
- Warm · cool sets time of day and mood
- Always unify mixed light

Intensity

Intensity

- Amount of light
- Inversely proportional to distance squared
- Twice as far, 1/4 the light

Contrast

Contrast

- Ratio of bright to dark
- Lighting ratio sets genre and emotion

Movement

Movement

- Whether the light changes
- Flicker · passing · reflected motion brings the frame to life

Using the inverse square law in practice

Put the light close to the person and the background darkens sharply; put it far away and person and background come out similar in brightness. To drop the background into darkness, don't buy more lights — pull the source in toward the person.

Exercise 4.1

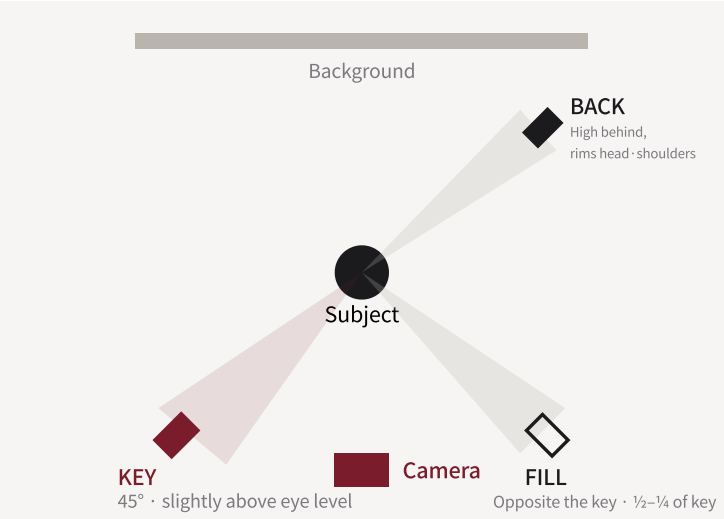
Task	Shoot the same face with hard and soft light, and with high and low sources, and compare the properties of light.
Tip	Source size (relative to the subject) determines softness.
Assessment	Distinguishing and explaining light's direction · quality · color · intensity · movement
Model answer	Draw a lighting diagram next to each photo to link cause and effect.

PART 04 Lighting and sound

4.2 Three-point lighting and its variations

Know the roles of the three lights — key · fill · backlight — and the formula for lighting people comes into view. Background lights and eye lights extend it.

Key first, fill tames the shadow, back separates



Top view

Key first, fill tames the shadow, back separates — lighting is order, not quantity

On set — same layout

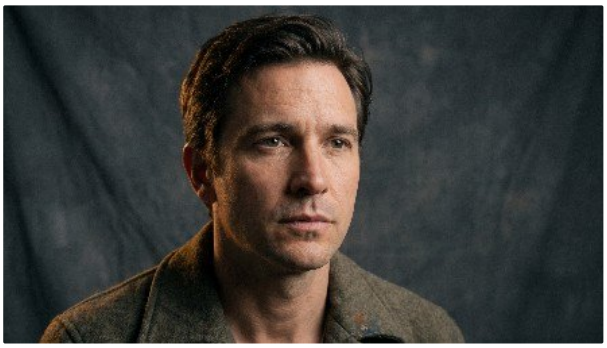
Left softbox is the key, small lamp at right the fill, high lamp behind the backlight

Figure 40 3-point lighting — plan and real setup. Results: Reference photos 4.2A below (key only → key+fill → key+fill+back → back only).

Reference photos 4.2A Generated images — staging reference

a

Key light only



b

Key + fill

c

Key + fill + backlight

d

Backlight only — outline left, a silhouette

Main light

Key light

- The most important light; sets form and shadow
- Start 45° left or right of camera, 45° up

Support light

Fill light

- Controls the depth of the key's shadows
- Must be weaker than the key — kill the shadows and depth goes too

Rear light

Backlight

- Rims the subject to separate it from the background
- Also called rim light · hair light

Fourth light

Background light

- Lights the background separately for depth
- 3-point lighting, extended

Eye reflection

Eye light

- Eyes without catchlights look lifeless
- One reflector fixes it

TIP

The fill doesn't have to be a separate light. One white reflector is often enough.

Reflectors and bounce — fill without a light

01 The surface color is the light's character. White gives soft, natural fill; silver, bright and hard fill; gold, warm sunset light; black is negative fill that takes light away.

02 Distance sets softness. The closer the reflector to the subject, the larger the source and the softer the shadow edge.

03 Negative fill subtracts light instead of adding it. A black board on the shadow side brings back contrast and slims the face.

04 Check the catchlights. Tilt the reflector up from below eye level and a small point of light appears in the pupils.

05 Fix outdoor backlight. Put the sun behind the subject and fill the face with a reflector: you get a rim light on the hair and a well-exposed face at once.

06 For two people, put the reflector in the middle. In a face-to-face interview, one white board at center, opposite the key, fills both faces at once.

Reference photos 4.2C Generated images — reflectors and negative fill

a
Bounce — the cheapest fill light

b
Negative fill — contrast by removing light

Lighting ratio — key-to-fill brightness

2:1	4:1	8:1 or more
Plain, bright ads	Standard drama	Dramatic, heavy mood

G-11 3-point lighting on set — key · fill · backlight and camera

Exercise
4.2

Task	Shoot 3 stages in order, key → key+fill → key+fill+back, and show the difference.
Tip	Start the fill at half the key's brightness or less. Write down the ratio.
Assessment	Ratio logged, backlight separation
Model answer	Gets both high key and low key from the same setup by changing only the fill.

PART 04 Lighting and sound

4.3 Key light in brief

Six rules for when time is short. Try to finish the frame with the key light alone. If it doesn't look good now, adding light won't make it better.

Where you put the key light decides how the face reads

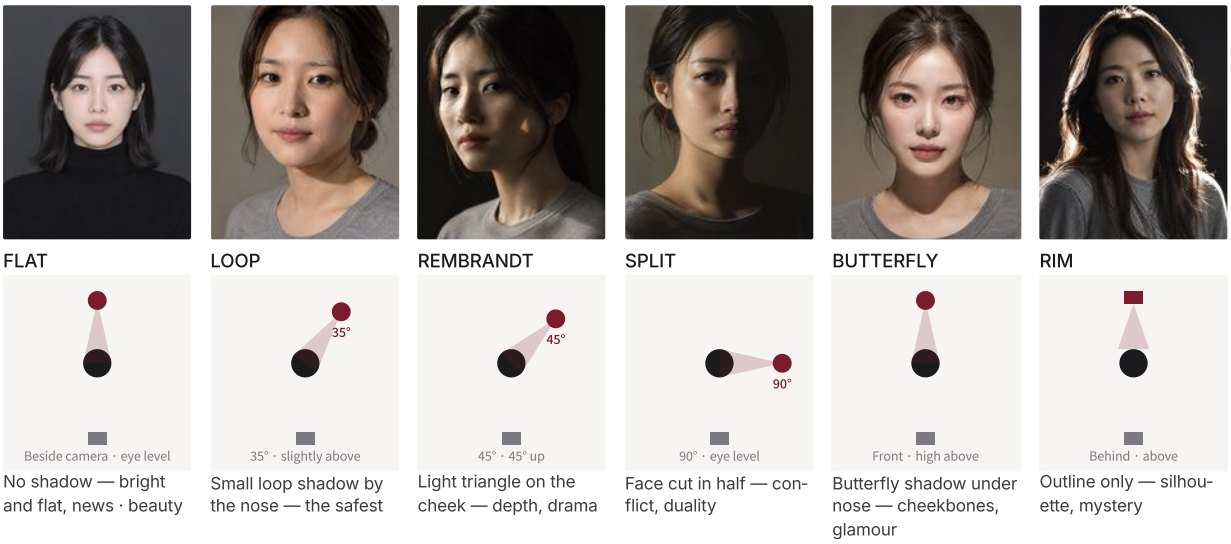


Figure 41 6 portrait lighting patterns by key-light position — only the one light moves. In the plans below, the red dot is the key light, the gray square the camera.

01 Set the key light first. Turn off every other light and try to finish the frame with the key alone.

02 Start at 45° and 45°. The reference point is where the nose shadow makes a small triangle on the far cheek.

03 Keep the source big and close. Enlarge it with a softbox or diffuser and bring it as near the subject as you can.

04 Don't erase the shadows. Fill light is a tool for controlling depth, not for wiping out shadow.

05 Separate with a backlight. If subject and background merge, add one high, opposite the key.

06 Put light in the eyes. It's the item most often missed in ads with people, and one reflector fixes it.

Note

Rembrandt, 45° side-high, is the default for people. Other patterns move the source from this point.

Faces by key-light angle

Angle	Name	Shadow shape	Impression	Use
Front 0°	Flat lighting	Almost no shadow	Flat, youthful, bright	Beauty ads, comedy
45° side-high	Rembrandt	Triangle on far cheek	Classic, deep	Portrait default
90° side	Split	Half the face dark	Duality, conflict	Dramatic shots
Top center	Butterfly	Butterfly under nose	Glamorous, commercial	Fashion, beauty
Rear 135°	Rim lighting	Only edges lit	Mystery, silhouette	Teasers, openings
Below	Underlighting	Upward shadows	Eerie, menacing	Horror, twists
45°, lower	Loop	Loop-shaped nose shadow	Soft, natural	Interviews

Exercise 4.3

Task Run an 'emergency' drill: with no lighting gear, secure one key light within 10 minutes and shoot a portrait.

Tip Look for windows, monitors and white-wall bounce first.

Assessment Judgment within the time limit, steady face exposure

Model answer Maps the light sources around and explains the choice.

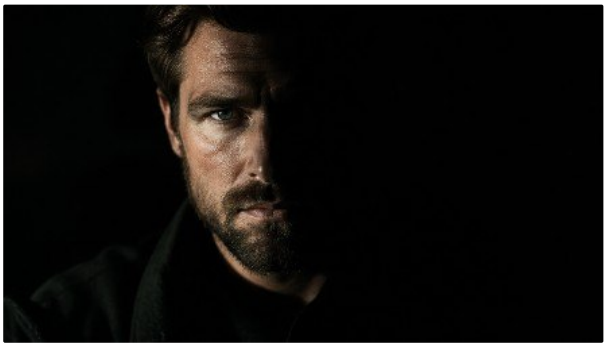
PART 04 Lighting and sound

4.4 High key and low key

Low key isn't about shooting dark. It's about exposing the bright parts precisely and controlling the rest into darkness.

Reference photos 4.4A Generated images — staging reference

a
High key — bright, forgiving light



b
Low-key portrait — darkness rules

c
Low-key product — luxury and focus

d
High-key product — white background · no shadow · clean

The key–fill gap sets the face's depth and mood

2 : 1 1 stop apart
Bright, easy — ads · beauty · information

4 : 1 2 stops apart
Standard portrait — default for interviews · drama

8 : 1 3 stops apart
Dramatic — tension · confession · just short of noir

16 : 1 4 stops apart
Low key — darkness rules the face

> Lighting ratio = bright side : dark side. The key stays put; only **the fill's intensity** changes. Turn off the fill and the ratio grows; match it to the key for 1:1 — the shadow disappears.

Figure 42 Contrast by lighting ratio — same model, same key, only the fill in four steps.

High-key lighting

- Bright overall, faint shadows
- Ratio 2:1 or less; background lit too
- Mood: bright, clean, safe, cheerful
- Use: food, kids, household, medical
- Note: keep depth with a backlight

Low-key lighting

- Darkness dominates; only parts lit
- Ratio 8:1 or more; dark background
- Mood: luxury, tension, mystery, focus
- Use: liquor, cars, perfume, electronics
- Note: underexposure isn't low key

Term

Negative fill — taking light away with black cloth and black foam board. It's half of low-key lighting.

G-12 High key and low key — same person, different worlds of light and shade

> Low key isn't shooting dark; it's exposing the bright parts precisely and controlling the rest.
>
> 4.4 High key and low key

Exercise 4.4

Task	Shoot the same person in high key and low key and make 2 posters for different genres.
Tip	For low key, move the subject well away from the background so no light falls on it.
Assessment	Contrast that fits the genre's mood
Model answer	Film-noir low key, sitcom high key. Proves that tone alone changes the genre.

PART 04 Lighting and sound

4.5 Lighting for product ads

Material decides the method. Does it reflect, transmit or absorb? How a product takes light determines how you light it.

Reference photos 4.5A Generated images — staging reference

a

Glass — backlit transparency

b

Metal — strip-light reflections

c

Food — steam and gloss from backlight

d

Drinks — backlight makes liquid glow, rim outlines the glass

Material	Light behavior	Key technique	Pitfalls
Metal, glass	Reflects	Large panel source makes reflections that show form	Crew and gear reflected
Liquid, clear	Transmits	Light from behind brings out color and clarity	Remove background reflections
Fabric, paper	Absorbs	Hard side light brings out weave and texture	Front light kills texture
Matte plastic	Diffuses	Soft top light, side fill	Easily looks flat
Food	Mixed	Backlight for steam and gloss, side light for form	Changes over time
Cosmetic containers	Reflects + transmits	Strip lights left and right for vertical highlights	Control logo reflections

TIP

Fingerprints and dust eat the most post-production time. Clean up with microfiber and an air blower before shooting.

- Kill unwanted reflections with black cloth and make the bright surfaces you want with white cards. Product shooting is as much taking light away as adding it.
- Don't erase the shadow under the product; design its direction and density. Shadow creates weight.
- A reflection over the logo makes the brand vanish. Set the logo angle first, then light to it.

Nine tricks for 'staging' a product

TIP

Cosmetics are glossy. The highlight's shape on the container reads as product quality, so take the time to make it long and straight.

01

Moisture · mist

- Gear: spray bottle, glycerin and water 1:1
- Note: shoot before droplets run; avoid the logo

02

Glass · acrylic reflection

- Gear: black acrylic or glass sheet, strip light
- Note: what reflects is the lights and ceiling, not the product. Dust the sheet

03

Splash · high speed

- Gear: camera at 120fps or more, strong light, rain cover
- Note: a fast shutter needs twice the light or more. Keep water away from electrics

04

Turntable spin

- Gear: motorized turntable, fixed lights
- Note: spin slowly; aim for when a highlight crosses the product

05

Multiples of one product

- Gear: 3–5 identical products, white backdrop
- Note: align the labels; use only fresh units, no fingerprints

06

Light pass

- Gear: handheld LED tube or small panel, dark set
- Note: the speed of the pass is the rhythm. One direction at a time

07

Backlit transmission

- Gear: panel source behind, diffuser
- Note: show the contents' color, but keep the background from blowing out

08

Clean reflections with black cards

- Gear: black foam board, clamps, small stands
- Note: more taking away than adding. Clean the logo reflections first

09

Macro texture shot

- Gear: macro lens, hard side light
- Note: depth of field is thin, so set the focus point in advance

Reference photos 4.5B Generated images — product staging tricks

a

Glass · acrylic — light what gets reflected

b

Moisture and mist

c
Turntable and multiples

d
Splash — high speed

Note Light pass — moving light gives a still product time

Exercise
4.5

Task	Pick one glass, one metal and one fabric product and light each to suit its material.
Tip	Glass from behind, metal with a big reflective surface, fabric from the side to bring out the weave.
Assessment	Material feel, no stray reflections
Model answer	Submits a failed shot and a fixed shot made with the same lights.

PART 04 Lighting and sound

4.6 Chroma key lighting in practice

Chroma key succeeds or fails on distance. Keep the subject off the background, and fully separate background and subject lighting.

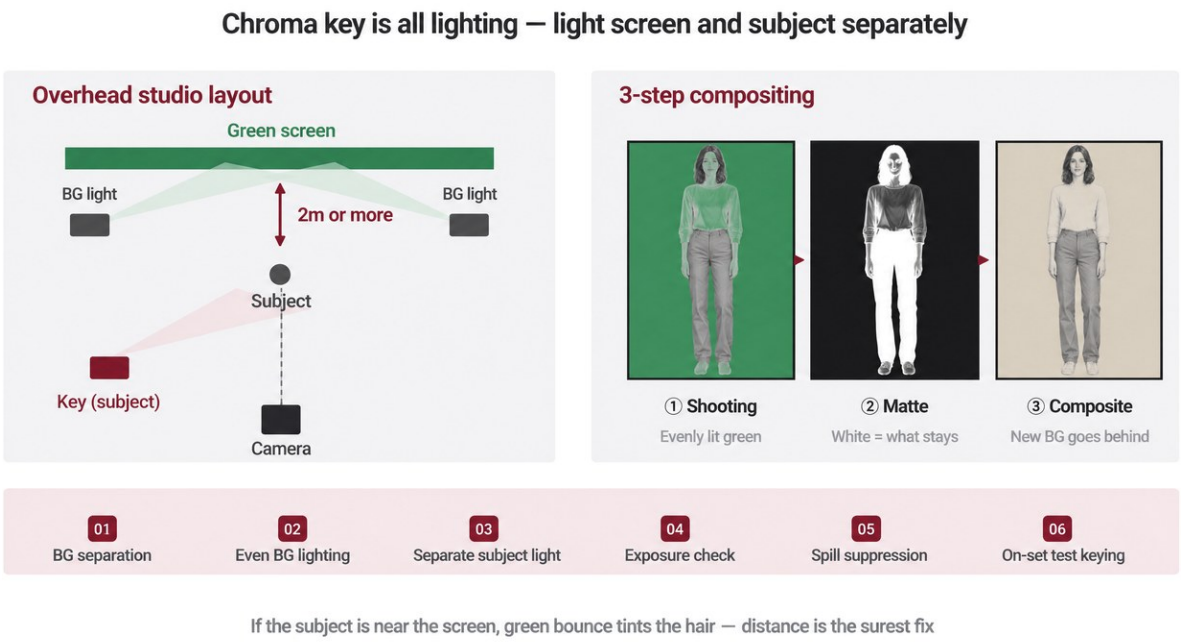


Figure 43 Chroma key studio layout and the 3 stages of compositing

Reading Figure 43

① Shoot: green lit evenly; subject 2 m in front, lit separately

② Matte: software turns the green transparent — only the white remains

③ Composite: put the subject on the new background, match color · shadow · edges

Three reasons it fails

Patchy green (uneven brightness) → holes in the matte

Subject near background → shadow + green reflection (spill)

No backlight on hair → messy edges

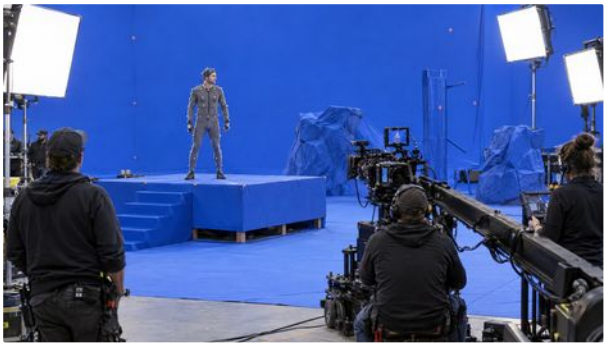
01	02	03	04	05	06
Separate the background	**Light the background evenly**	**Separate subject lighting**	**Check exposure**	**Suppress spill**	**Test-key on set**
At least 1.5–2m from subject to green screen. Distance kills shadows and bounce	2 dedicated lamps crossed at 45° left and right. Variation within 1 stop	Keep it fully apart from the background light; a backlight defines the hair edge	Green about 1 stop under the face, or equal. Overexposure makes edges bleed	Distance, backlight and a magenta-tinted fill cut green contamination	Try it at once on a laptop. Once you leave the studio, it can't be fixed

Reference photos 4.6A Generated images — staging reference

a
An even green screen

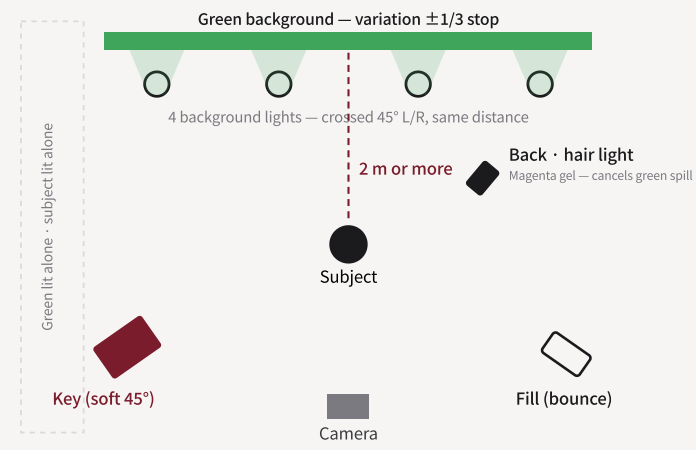
b
Spill — green on the edges

c
Finished composite



d
Blue-screen VFX stage — marker suits · blue props · large lights

Light background and subject separately



Keep the two worlds apart

The 4 background lights hit only the green — never the subject

The 3-point setup lights only the subject — no shadows on the green

2 m between them — distance kills both shadow and green bounce

Three checks on set

Green exposure = same as the face or 1 stop under

Backlight on the hair edges

Key it on the spot on a laptop

Figure 44 Chroma key lighting plan — 4 background lights fully separated from 3-point subject lighting. A 2 m gap is the surest fix.

Term

Spill — green light tinting the subject's clothes and skin.

Troubleshooting by symptom

Symptom	Cause	On-set fix	Post fix
Green fringe on edges	Spill or hot background	More distance, less background light	Spill suppression, matte choke
Mushy hair	No backlight, 4:2:0	Add backlight, shoot 4:2:2	Add a reference matte
Patchy background, shadows	Uneven light, too close	Cross-lighting, more distance	Garbage matte, split keying

Symptom	Cause	On-set fix	Post fix
Subject looks pasted on	Light direction mismatch	Pick the background first, then light	Color matching, unified grain
Edges jitter in motion	Smear from slow shutter	Stick to 180° shutter	Regenerate motion blur
Green clothing vanishes	Color clash	Check wardrobe ahead	Unfixable; reshoot

Reference photos 4.6B Generated images — chroma key lighting on set

a

Chroma key setup — light background and subject separately

b

Measuring evenness — variation ±1/3 stop

G-13 A chroma key shoot — separating background and subject lighting

Exercise
4.6

Task	Shoot a person in front of a chroma key backdrop and finish the composite.
Tip	Keep 2m or more between subject and background, and light each separately.
Assessment	Even background, spill control, light matching the new background
Model answer	Sets the subject's key position in advance to match the light direction of the composite background.

PART 04 Lighting and sound

4.7 Low-budget lighting substitutes

You can light without lighting gear. A window, foam board, tracing paper and black cloth do the job of 3-point lighting.

A giant softbox
Window
- North-window light is the best soft light
- Use a white curtain as a diffuser

Fill and negative
A pair of foam boards
- White board is fill; black board makes shadow
- Together, worth one light

Softening
Tracing-paper diffuser
- Hang it in front of direct light to soften
- Always keep it away from hot lights

Motivated light
Using practicals
- Lamps, signs and monitors in frame as sources
- Realism and motivation at once

Taking light away
Negative fill
- Black cloth takes light away to build contrast
- Costs nothing

Small highlights
Smartphone light
- Good for small highlights in product close-ups
- Match its color temperature

Safety rules

Keep plenty of distance between hot lights and paper or cloth, and always put sandbags on light stands. The most common accidents in class shoots are toppled lights and burns.

How materials answer light — same lighting, six materials

Glass · water

Light passes through and bends — light from behind (backlight) and bring out the edge lines

Metal

Mirrors light back — the source's shape shows, so give it a big white surface (strip) to reflect

Wood · matte

Scatters light every way — directional side light reveals the grain

Cloth · velvet

Eats light — without an edge backlight, the form disappears

Skin · wax

Light sinks below the surface and spreads — big soft source; strong backlight glows red through ears

Emitters

Glow on their own — darken the surroundings, expose for the glowing surface, bloom in post

Figure 45 How materials respond to light — six materials under the same lighting (key softbox + rim). Lighting isn't placing light; it's knowing how a material answers it.

Lighting in 3D tools — same vocabulary, different physics

Lighting setup in 3D tools — same order as on set

① Environment light (HDRI) for a base level of 10–20%

② One Area Light as key — size is softness

③ A weak Area opposite as fill (Shadow off)

④ A Spot from behind as rim

⑤ Adjust materials (Roughness · Metallic · Transmission), then check the lighting again

How it differs from set

Light doesn't bounce off walls → add bounce yourself

Intensity is relative, not watts — set it by eye

Set brightness with render exposure (EV), not camera exposure

Figure 46 Lighting setup in a 3D tool — light gizmos in the viewport (key · fill · rim) and the properties panel. Vocabulary and order match on-set lighting.

Exercise
4.7

Task	Build a 3-point lighting kit for 50,000 won or less and actually shoot with it.
Tip	Work lights, tracing paper, foam board and clamps are the basics. Mind heat and electrical safety.
Assessment	Quality for the cost, safety check
Model answer	Rather than receipts, compiles a parts list, unit prices and setup photos together.

Feature · LIGHTING TOOLS

4.7+ Tools of light — fixtures, beams, and light in software

Learning lighting is not memorizing fixture names; it is knowing which tool controls the **size · distance · angle · intensity · color** of light. This feature puts on one map the real fixtures and modifiers used on set, the beams from pin spot to ambient, and the After Effects · Premiere functions that rebuild the same light.

SPREAD 01

A map of light sources — twelve fixtures and the light each makes

Reference photos 4.7A Generated image — twelve light sources

Fresnel	Tungsten 650W–2K · LED 150–300W	Hard→medium, spot/flood 10–60°. Standard key · backlight	Spot · cone 30–60 · feather 50
Open-face · redhead	800W–2K tungsten	No lens → broad, raw hard light. Source for diffusion · bounce	Point · intensity↑ · harsh falloff
HMI · PAR	575W–18K · 5600K	Recreates sunlight. Check ballast · generator · flicker	Parallel · crisp shadows
LED panel (bicolor)	30–200W · 2700–6500K	Area source · light · battery. Fill · support within 1.5m	Large Spot feather 100 / Ambient
LED COB + softbox	100–600W · Bowens	Standard key on small sets. Box size = softness	Spot cone 90 · feather 100
LED tube RGBWW	30–120cm · full color	Line source → long highlights. Neon · practical tones	Long Solid + Glow / Light Sweep
Kino · fluorescent bank	4ft 4-bank	Broad, even soft light. Interviews · chroma key backdrops	Ambient + 2 wide Spots
Ring light	10–60W	Shadowless front light. Beauty · talk only	Point at camera + low contrast
China ball · lantern	Bulb + paper/cloth globe	Soft in all directions. Overhead 'room light', boom light	Point · falloff Smooth
Dedolight · pin spot	40–150W · 4–50°	Sharp beam. Product accent · catchlight · gobo projection	Spot cone 5–10 · feather 10–20
Practical (in-frame light)	Lamp · neon · candle · TV	The light's 'excuse'. Set exposure with bulb swaps · dimmers	Glow + Point at the same position
Reflector · black cloth	Light without power	White=soft, silver=hard, gold=warm, black=subtract	Ambient↓ / dark Solid mask

Check before the fixture name: hard or soft, narrow or wide, how many K. The last column is the After Effects 3D light that recreates the same light.

SPREAD 02

From pin spot to ambient — five lights set by beam angle

From pin spot to ambient — five lights set by beam angle

PIN SPOT
4–10° · very narrow
One face only — stage solo, product highlight

SPOT
15–30° · narrow
A circle with a visible edge — Fresnel, Leko · accent and separation

FLOOD
45–70° · wide
Broad and even — open-face, LED panel · base lighting

SOFT
diffused · no edge
Wrapping light — softbox, book light · skin · interviews

AMBIENT
non-directional · all around
Shadowless base level — ceiling bounce, overcast day

← narrow · hard · crisp edge · dramatic wide · soft · no edge · overall →

Plate LT-2 Five lights by beam angle — same person, same spot; only the tool in front of the lamp changed. Toward the left you decide "what to show"; toward the right, "how bright."

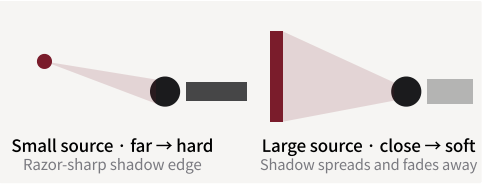
Beam	Angle	Shadow edge	Used for	Typical fixtures · accessories	AE 3D Light settings	Common mistake
Pin spot	4–10°	Razor-sharp	Single product accent, catchlight, gobo pattern	Dedolight, snoot, projection attachment	Spot · Cone 5–10 · Feather 10	Pin spot on a face → blotchy
Spot	15–30°	Defined	Portrait key (dramatic), stage, backlight	Fresnel spot, COB standard reflector, barn doors	Spot · Cone 30 · Feather 40	No barn doors; spills onto the wall
Flood	45–70°	Blurry	Backdrops · chroma key wall · groups	Open-face, LED panel, Fresnel flood	Spot · Cone 70 · Feather 80	Subject and background equally bright
Soft	Area source	Almost none	Portrait key · fill, beauty, matte products	Softbox 60–120, diffusion 216/250, bounce	Spot · Cone 90 · Feather 100 · Shadow Diffusion 20+	Source set too far; turns hard again
Ambient	Non-directional	None	Exposure floor, overcast-day look	Ceiling bounce, large book light, diffused window	Ambient · Intensity 10–30%	Uses ambient only, then wonders why it looks 'flat'

SPREAD 03

Tools that change light — size · distance · direction · intensity · color, five control knobs

Softness = apparent size of the source

Left hard · right soft
Same face, same exposure. Left: one bare bulb; right: a 2 m softbox



What separates hard from soft
Not the type of lamp but the

size
of the source as seen from the subject. Make it bigger (diffusion · bounce) or bring it closer, and it softens

Modifiers — what each controls

- Softbox · diffusion → size (softness)
- Bounce (ceiling · wall · foam board) → size + direction
- Grid · barn doors → cut spill
- Flag → blocks light
- Gel (CTO · CTB) → color
- ND → brightness only

Plate LT-3

Hard and soft — set by the source's "apparent size" and distance. Modifiers are the knobs that change these two.

2x	216 / 250	5600K	1 only
Distance → 1/4 brightness (−2 stop)	Full / half diffusion — approx. −1.5 / −0.8 stop	Daylight · 3200K tungsten · CTO = 5600→3200	Shadow direction per frame

SPREAD 04

Eight lighting setups — learn them as top-down plans

Eight setups — seen from above

01 Basic 3-point
Key 45° + fill + back · where interviews start

02 Rembrandt
Key 45° high + black board · triangle of light on the cheek

03 Butterfly
Key front and above + reflector under the chin · beauty

04 Split
One key at 90° · face cut in half

05 Loop
Key 35° + weak fill · the safest choice

06 Book light
Key → bounce → diffusion · the softest light

07 Backlight · rim
Two lamps behind, both sides + front bounce · outline only

08 Product top light
Big soft above + strip behind + white boards on both sides

Plate LT-4

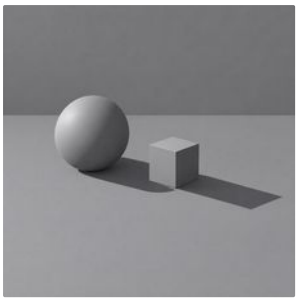
Eight lighting setups — the same studio and the same subject in the same spot; only the lamp positions change in this 3D setup. As photos they are remembered as a "mood"; as plans, as "angles."

SPREAD 05

Light in software — four After Effects 3D lights and light-effect tools

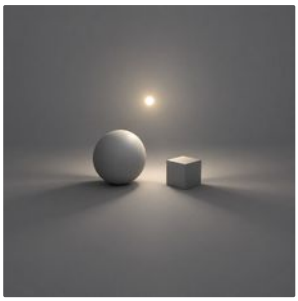
After Effects 3D lights are a scale model of set lighting. They use the same vocabulary (spot · point · ambient) and control the same properties (intensity · color · cone angle · falloff · shadow). If you can handle light on set, you will make the same calls in software.

Light in software — four lights

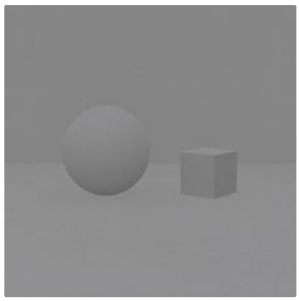


Parallel
On set · sun · HMI
Parallel and even — all shadows fall the same way, regardless of distance

Spot
On set · Fresnel · softbox
Cone — the default key light. Cone Angle · Feather · Falloff



Point
On set · bulb · candle · tube
In all directions — dims with distance (Falloff)



Ambient
On set · ceiling bounce · overcast day
Shadowless base level — 10–30% only; more goes flat

Setup order

① Ambient at 10–20% for base level
② One Spot as key (Shadow on)
③ Point or weak Spot as fill (Shadow off)
④ Spot from behind as rim
⑤ Material options: Accepts Shadows · Casts Shadows

Plate LT-5 — Four After Effects 3D lights and their on-set equivalents — the same sphere and box, lit by each of the four lights alone. Light in software is a scale model of set lighting.

Task on set	After Effects	Premiere Pro / Resolve	Key parameters · tips
Light a single point with a spot	3D Spot Light · or a white Solid with Mask + Feather, Blend Add/Overlay	Lumetri Vignette (inverted) · Masked Curves	Mask feather 200+ · opacity 20–40% · a touch of color at the edge (warm)
Window-bar · leaf gobo patterns	Fractal Noise → Levels → Track Matte / Light Transmission	2 Masked Lumetri (bright/dark)	Animate Evolution slowly for 'shadows swaying in the wind'
Backlight rim · bloom	Light Wrap (with Keylight) · Glow (Threshold 70–85) · CC Light Rays	Lumetri Highlights↑ + Glow (plug-in)	Set Glow's Composite Original to 'Behind' to keep it subtle · set Light Rays to the source position
Lens flare	Lens Flare (built-in) · Optical Flares (plug-in) · CC Light Burst 2.5	Lens Flare (built-in)	Link source position to tracking data · brightness 60–80% · Screen blend
Sweep light across a logo	CC Light Sweep · Shine(Trapcode)	Light Sweep (Legacy) · mask animation	Width 30–60 · Sweep Intensity 20–40 · once within 1 second, never twice
Cast a shadow (compositing)	Drop Shadow(2D) · Radial Shadow · 3D Light Casts Shadows · Shadow Catcher	Drop Shadow (built-in)	Softness 20–40 · Opacity 40–60 · direction matches the key light
Refine overall exposure · contrast	Lumetri Color · Curves · Exposure · Levels	Lumetri Basic: Exposure · Contrast · Highlights · Shadows · Whites · Blacks	Order: exposure → WB → contrast → highlights/shadows → only then the look
Negative fill (darken)	Black Solid + Mask + Multiply · Vignette	Lumetri Vignette Amount −1 to −2 · Masked Curves	Darken the edges by 1 stop and the eye moves to the center
Color temperature gel	Tint · Color Balance · Lumetri Temperature	Lumetri Temperature / Tint	CTO look: Temperature +10–20 · warm highlights/cool shadows via Color Wheels
Practical flicker · candlelight	wiggle(4, 20) expression on Point Light Intensity	Opacity keyframes · plug-ins	Frequency 2–5Hz, amplitude 10–20% — any more is a broken fluorescent

TIP

Names change (versions · plug-ins). What does not change is the order **intensity** → **direction** → **size** → **color**, and the rule that there is one shadow direction.

Software light 'adds to' the light on set; it does not 'make' it. Get the one shadow direction right during shooting, and you can layer anything on in post-production.

SPREAD 06

On-set lighting cheat sheet — an order that gets setup done in 10 minutes

01
Off

Turn off every fluorescent · stray light in the room. Start from darkness.

02
One key

Key at 45°/45° to the subject. Expose for the key (f/2.8, ISO 800 baseline).

03
Fill

A reflector on the opposite side, or a soft at 1/3 intensity. This sets the contrast ratio.

04
Separate

Back/rim or background light. Background 1 stop darker than the subject.

05
Color · tidy

Unify color temperature, cut spill with barn doors · flags, safety (sandbags · cables).

Contrast ratio

Key : fill

- 2:1 (1 stop) — bright, commercial, beauty
- 4:1 (2 stops) — standard drama, interviews
- 8:1 or more (3 stops+) — noir, thriller
- No fill — silhouette, split

Color temperature

If you mix, mean it

- Daylight 5600K · tungsten 3200K · fluorescent 4000–4500K
- Window + tungsten → CTO on the window or CTB on the lamp
- Mix only one way: 'window=cool, interior=warm'
- Set camera WB to the key light

Safety

Accidents start with lighting

- A sandbag on every stand, cables taped to the floor
- No gel · cloth within 30cm of tungsten (fire)
- Add up the load: 1 household circuit ≈ 3kW
- Above 2m, a 2-person job

Symptom	Cause	Fix
Face looks flat	Key too close to the camera axis, or too much ambient	Move key 30° to the side · up, kill stray light, negative fill
Two shadows	Key and fill both hard	Make the fill soft (bounce), 1/3 intensity
Shiny skin	Small hard source, head-on	Diffusion · softbox, makeup powder, raise the angle
Background as bright as the subject	Flood reaches the background	Barn doors · flags, bring the key close to the subject (inverse square)
Glare on glasses	Source head-on at eye level	Key higher and to the side; lift the glasses' arms slightly
Green cast	Fluorescents mixed in	Turn off fluorescents, or set WB to fluorescent and put plus-green gel on the key
Flicker	Shutter out of sync with LED · HMI	Shutter 1/50 (50Hz), flicker-free fixtures, test shoot

Exercise
4.7+

Task	Keep the same subject · same spot and shoot one cut in each of five lights: pin spot / spot / flood / soft / ambient. Draw a lighting plan (top view) for each cut. Recreate one of them in After Effects with Spot · Point · Ambient 3D lights.
Tip	No gear? Substitute a flashlight (pin spot), a desk lamp (spot), a window (soft), and an overcast day (ambient). What matters is seeing the difference in shadow edges with your own eyes.
Assessment	Difference in shadow edges across the five cuts, angles marked on the plans, matching shadow direction in the software recreation
Model answer	Place the five cuts side by side on one screen and caption each with one sentence on which emotion its light suits.

Background 6

How sound changes the image

We say we 'watch' video, but in fact we build one experience by seeing and hearing. In Audio-Vision (1990), the French composer and theorist Michel Chion proposed the idea of 'added value': when sound is added to an image, the audience mistakes its effect for the power of the image itself. The sound effect as a fist lands makes a far stronger impact than the real blow, yet the audience remembers the picture as intense. That is why good sound design goes unnoticed.

Chion also coined 'synchresis': the perceptual tendency to weld a sound and an image that occur together into one event. It's why a Foley artist can snap celery to make the sound of a breaking bone. Recording footsteps or the brush of a collar separately is called Foley after Jack Foley, who pioneered the field.

Sound divides into sound with a source inside the story world and sound without one. Radio music a character hears is inside the story; background music only the audience hears comes from outside it. The moment we learn that what we took for score is actually playing in a character's earphones, the audience steps into that character's inner world.

Editor and sound designer Walter Murch was credited as 'sound designer' on Apocalypse Now (1979), raising sound to a creative field with the same weight as cinematography or editing. He stressed designing the mix around the limit of how many overlapping layers of sound an

audience can tell apart in one scene. Choosing what to keep matters more than putting a lot in.

In short-form and on mobile, many viewers watch with the sound off. The design has to work on captions and picture alone, yet for viewers with sound on, the first 1 second of sound can be the strongest hook. The mics and sound design of chapter 4 start from keeping both audiences in mind.

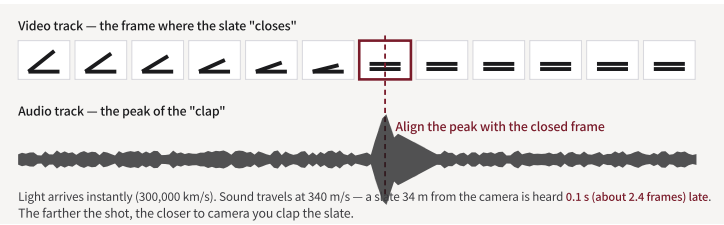
Further reading — Michel Chion, Audio-Vision · David Sonnenschein, Sound Design · Walter Murch, In the Blink of an Eye

PART 04 Lighting and sound

4.8 Microphones and recording

A cheap mic up close always beats an expensive mic far away. Sound is decided by distance.

We see by light, hear by air — so sound must be "synced"



The slate — seeing and hearing pinned to one point

Frame where the sticks close = peak of the waveform. Overlap the two in the edit and picture and sound line up

Figure 47 Sync — seeing is faster than hearing. The eye takes in light and the ear vibrations of air, so sound always arrives a little late. The slate is the "common reference point for eye and ear" that closes the gap.

Recording levels — the safe zone

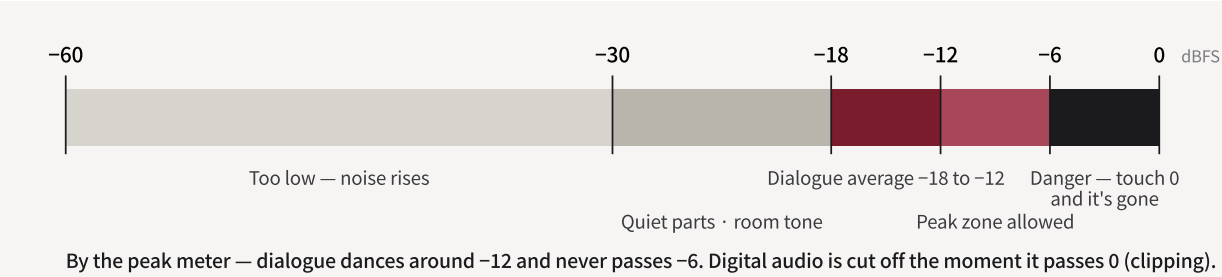


Figure 48 The safe zone for recording levels — quiet sound can be raised later, but distorted sound can't be revived. Always a little low.

Type	Features	Best distance	Use	Pitfalls
Shotgun mic	Narrow pickup, from afar	0.3–1m	On-set dialogue on a boom	Sound drops sharply off-axis
Lavalier	Clipped on, close pickup	About 20cm	Interviews, testimonial ads	Clothing rustle
Wireless lavalier	Moves without cables	About 20cm	Moving shots, multiple people	RF interference, batteries
Handheld	Held in hand	10–20cm	Field interviews	Shows in frame
USB condenser	High quality indoors	15–30cm	Narration, dubbing	Room echo must be controlled
Built into camera	Backup only	-	Reference audio for sync	Never for main recording

Polar patterns

Which directions a mic hears

Omni
All directions equally
Lavalier · sense of space

Cardioid
Takes the front, rejects the back
Interviews · vocals · most common

Supercardioid
Narrower front, a little rear
Boom · on-set dialogue

Shotgun
Very narrow front — even from afar
Boom mic · outdoors · documentary

Fig-8
Takes front and back, rejects the sides
Face-to-face talk · MS stereo

Boom shotgun — just above frame, aimed at the mouth
Narrow pattern = slightly off-angle and the sound thins

Studio condenser — narration · dubbing
Cardioid · pop filter · 15–30 cm · tame the room's echo first

Figure 49 Mic polar patterns — the red solid is the pickup zone. A person inside it sounds clear; one outside sounds distant. The narrower the zone, the clearer from afar, but the more sensitive to angle.

Omni

Omnidirectional

- Picks up all directions evenly
- Lavalier standard; natural sense of space
- Noise comes in too

Cardioid

Unidirectional

- Heart-shaped, facing front
- All-purpose; rejects rear noise

Super / Hyper

Super · hypercardioid

- Narrower front pickup, shotgun family
- Hears some rear sound, so check for noise behind

Figure-8

Bidirectional

- Front and back in, sides out
- Suits two-person, face-to-face interviews

Reference photos 4.8A Generated images — staging reference

a Boom shotgun — aimed from above

b Lavalier — hidden in the collar

c Field interview recording

Three mics on today's sets

1-person · small crew

Compact 2-channel wireless kit

- DJI Mic, Rode Wireless, Hollyland Lark and similar
- 2 transmitters + 1 receiver; 32bit float and onboard recording in the transmitters insure against clipping
- Receiver plugs straight into a phone · camera USB-C port
- Note: collar rustle; event venues thick with 2.4GHz interference

Interview · drama

Shotgun + boom

- Aimed at the mouth from above, out of frame
- Natural sense of space; several people on one mic
- Needs a boom operator and a recorder
- Note: going off-axis, ceiling reflections

Fastest setup

Plug-in lav for phones

- Plugs into USB-C or Lightning; records at once, no app
- Vlogs · short-form · quick field interviews
- Note: you can move only as far as the cable; check for models with no manual level control

Reference photos 4.8B Generated images — mics on today's sets

a
Compact wireless mic

b
Boom mic

Note

Touch 0dBFS and it clips beyond recovery. Keep peaks between −12dBFS and −6dBFS.

−12 dBFS
Lower bound for peaks

−6 dBFS
Ceiling peaks must not pass

30 s
Room tone before you wrap

- Aim the boom down at the mouth from above. From below, it also picks up floor reflections.
- Indoors, avoid angles parallel to the walls to cut echo.
- After shooting, record the location's silence, or room tone, for 30 seconds or more. It's what fills the gaps between lines naturally.

G-14 Types of mic — shotgun · lav · handheld · recorder

Exercise
4.8

Task	Record the same line with the built-in camera mic, a shotgun and a lav, and compare.
Tip	Aim for levels around −12dB, with peaks no higher than −6dB.
Assessment	Levels, noise differences noted
Model answer	Makes a table recommending the best mic for each space (classroom, hallway, outdoors).

PART 04 Lighting and sound

4.9 The four layers of sound design

Narration, music, sound effects, sound logo. The sound of a 15-second ad is a design that lays four layers out over time.

Sound is built in four layers

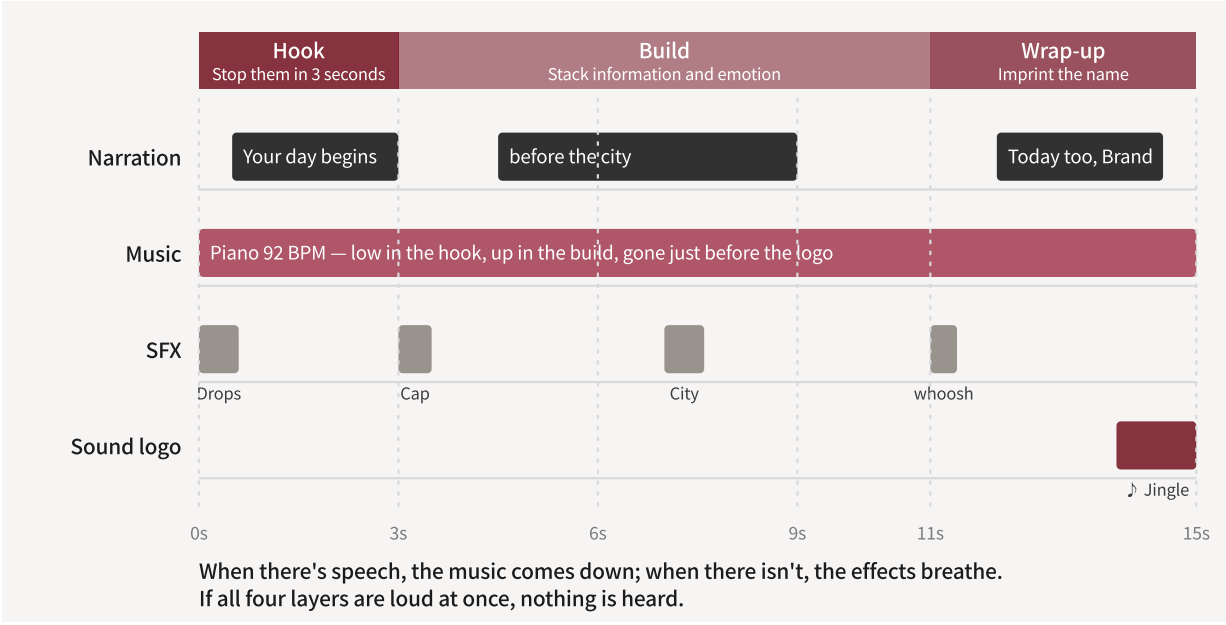

Figure 50 4-layer sound timeline of a 15-second ad — narration · music · sound effects · sound logo. Horizontal is time; blocks are where sound is "heard".

Message
Narration and dialogue

- About 3 Korean chars in 1 second
- A 15-second ad caps total narration at 35–45 chars

BGM
Music

- Sets emotion and pace
- The baseline for cutting, so decide it first

SFX

Sound effects

- Creates physical realism
- Openings, footsteps and liquids double the picture's texture

Imprint

Sound logo

- Imprints the brand in sound
- 2–3 seconds, 3–5 notes, placed at the end

Section	Time	Music	Narration	SFX	Sound logo
Hook	0–3s	Strong entry or silence	None advised	1 impact	None
Build	3–11s	Keep the rhythm	1 key line	Synced to action	None
Wrap-up	11–15s	Resolve, let ring	Brand name, call to action	Minimal	2–3s at end

TIP

Silence is sound too. 0.5 seconds of total silence grabs attention harder than any sound effect. That's why short-form so often cuts the sound abruptly.

Ways to clear music rights

Route	Cost	Scope	Check
Subscription library	Monthly fee	Often incl. commercial use	Terms after you cancel
Single-track license	Pay per track	Within licensed scope	Media, term, territory limits
CC attribution music	Free	Use with credit	Edit and commercial terms
Platform audio	Free	Within that platform	No outside media
Create or commission	Production cost	Unlimited use	Rights-transfer contract
AI-generated music	Tool cost	Per the tool's terms	Commercial-use terms

No rule says short use is fine

Using part of a commercial track, using it after editing, or using it unlicensed but credited are all copyright infringement. Competitions and job portfolios increasingly ask for proof of music licenses, so keep purchase records and screenshots of the terms in the project folder.

Exercise

4.9

Task Add four layers in turn to 30 seconds of silent video: dialogue · effects · ambience · music.

Tip Lay ambience first to create space; put the music in last.

Assessment Distinct role per layer, mix balance

Model answer Also submits versions with each layer toggled on and off.

PART 04 Lighting and sound

4.10 Sound effects and Foley

Sound recorded on set alone leaves the picture thin. Most commercial video re-creates sound in post and lays it in. This is called Foley.

Sound	How it's really made	Used for
Footsteps	Re-create with real shoes and flooring	Movement, rising tension
Cloth rustle	Rub fabric by hand	Realism in close-up action
Product opening	Open and close the real product many times	The ad's decisive moment
Pouring liquid	Repeat with varied vessels and heights	Core of drink ads
Fire, wind, rain	Combine library sounds	Setting the mood
Impact	Low hit plus reverb	Transitions, logo reveals

TIP

Sync effects to the frame. Even 0.1 seconds late feels off.

Sound design, step by step

01 Watch the picture several times without sound. List the sounds it should have.

02 Lay dialogue and narration first and lock their levels.

03 Add music and match it to the cuts and beats.

04 Sync effects to the action frame by frame.

05 Lay ambience to create space. The quieter the scene, the more it needs ambience.

06 Normalize overall loudness to the platform's standard.

07 Check on three setups: earphones, speakers and a smartphone.

Content made of sound alone — ASMR · ambience · sleep audio

Close-up stimulus

ASMR

- Capture left-right space with binaural mics or a dummy head
- Triggers: tapping, brushing, whispering, paper
- Low level, about –20dBFS; keep peaks down

Sound of a space

Ambience

- Record fire · rain · wind · waves on location at length
- Hide loop points behind loud moments
- 8-hour long-form is made by looping a 1-hour source

Meditation · sleep

Sleep audio

- Low-end focused; no sudden peaks
- Picture: a still frame + subtle motion (rain, flames)
- Copyright: only licensed sources or your own recordings

Reference photos 4.10A Generated images — content made of sound alone

a

Recording ASMR — the head model in the middle is a **binaural dummy-head mic**. Two mics sit where human ears would be, capturing a "whisper in the left ear" just as heard. It only works on earphones

b

Foley work

c

Recording a crackling fire

d

8 hours of rain — a sleep-audio video

> When you feel your video skills have stalled, working on the sound is the fastest fix.
>
> 4.10 Sound effects and Foley

Going out to collect sound and texture

Going out for sound — field recording

A real forest at dawn, real waves. Everyone uses library sounds, so record "your own". Shotgun + windshield + portable recorder, 4–6 a.m., wind 3 m/s or less

Going out for texture — photogrammetry scans

Shoot rock · bark · walls dozens of times for 3D textures. Overcast day, one color chart, 70% overlap. What generative AI can't make is "the grain of that place"

Figure 51 Sound and texture are out there — people who gather sources instead of buying them. An artist's signature comes from legwork, not libraries.

Exercise
4.10

Task	Make 5 Foley effects from household items, such as footsteps, a door and rain, and lay them on a scene.
Tip	Record in a quiet room with the mic close, and time the actions to the picture.
Assessment	Sync accuracy, realism of the sound
Model answer	Finds sounds 'more convincing' than the real ones and reveals the materials used.

PART 04 wrap-up

Exercises and review

01 Four patterns from one light

With a single light or one window, shoot portrait close-ups in Rembrandt, split, butterfly and rim lighting, and compare all four.

02 High key vs. low key

Shoot the same product in high key and in low key, and ask ten people which looks more expensive.

03 Distance and sound quality

Record the same line on a smartphone at 30cm, 1m and 3m and compare. Hear how distance affects quality.

04 Redo it with effects only

Strip all the sound from footage you shot and lay in new effects only. You'll feel how sound changes the texture of the picture.

One-page summary

4.1 Five properties of light	With the inverse square law, you can make the background fall off without buying more lights.
4.2 3-point lighting and its variations	Lighting ratio 2:1 for bright ads, 4:1 for standard drama, 8:1 or more for a dramatic mood.
4.3 Six key-light patterns	Try finishing the frame with the key light alone. Softness comes from size and distance.
4.4 High key and low key	Low key isn't shooting dark; it's exposing the bright parts precisely and controlling the rest.
4.5 Lighting for product ads	Material decides the method. You take away as much light as you add.
4.6 Chroma key lighting	Keep subject and background 2m apart and light them separately.
4.7 Low-budget lighting	Window · foam board · tracing paper · black cloth. Beware of heat and toppling accidents.
4.8 Microphones and recording	A cheap mic close beats an expensive one far away. Peaks −12 to −6 dBFS, room tone 30 seconds.
4.9 The four layers of sound design	Decide the music first; the sound logo goes in the last 2–3 seconds. Keep proof of music licenses.
4.10 Sound effects and Foley	Effects sync to the frame. Working on sound is the fastest fix.

Self-check

- Can you apply the inverse square law to control background brightness?
- Can you explain what a 4:1 lighting ratio means?
- Can you explain why subject and background must be apart in chroma key?
- Can you give the safe zone for recording levels in numbers?
- Can you explain why room tone is needed?

Questions to consider

Q **Has a face ever come out dark in a video you made?**
Should you have added light then, or taken it away?

Q Which do you turn off first: a video with bad sound or one with bad picture?

Why is that?

MEMO · PART 04

PART 05

A cut is not where you slice.
It is where the audience breathes.

PART

05

What you make in this PART

1. A 1-minute edit cut down with purposeful cuts
2. A 5-second logo animation with easing
3. A delivery master with compositing · grading · output specs

Editing and post-production

Shooting gathers material; editing makes meaning. Change the order and length and the same footage becomes a different video. This PART moves from the history and principles of editing to a map of Premiere Pro, After Effects and DaVinci Resolve. The question that opens this chapter — what keeps people watching to the end?

Photo P-05 Night edit suite — timeline and grading monitor · generative image

Using this chapter in class

Cut for a reason and apply easing

Screen edits with music laid first vs. last	8 editing principles, action and match cuts, Premiere vs. After Effects roles	Explain easing with the bouncing ball and timing diagrams	Same footage, two 30-second edits	Agree on project folder naming

> Check point
>
> You can say in one line why you made each cut

PART 05

Introduction

Shooting gathers material; editing makes meaning. Change the order and length and the same footage yields an entirely different video. Kuleshov proved this 100 years ago, and it works even harder in the short-form era of ever-shorter cuts.

This part starts from the history of editing technology and lays out Premiere Pro and After Effects features systematically. The feature lists are a map, not something to memorize. Know which area of which tool a problem belongs to and one search solves it; without a map, you wander for hours.

After Effects in particular thinks differently from Premiere. Premiere handles time horizontally; After Effects handles layers vertically. Trying to cut in After Effects without knowing this is the classic beginner's mistake. Simply splitting the two tools' roles halves your working time.

Background 7

Invisible editing

Good editing keeps the audience from noticing the editing. A cut slices time and space, yet the audience must feel it as a natural flow.

Editor Walter Murch's In the Blink of an Eye (1995) likens a blink to a cut. We blink when a thought changes or our gaze shifts. A good cut likewise falls where one paragraph of the viewer's thought ends. So the editor looks first not at the screen but at where the audience's mind has reached.

Murch ranked the criteria for a cut: emotion 51 percent, story 23 percent, rhythm 10 percent, eye-trace 7 percent, the 2D plane of the screen 5 percent, 3D spatial continuity 4 percent. The order matters more than the numbers: pick the cut with the right emotion even if continuity slips a little. Student work often flips this order, clinging to matched action and losing the emotional flow.

Continuity techniques — cutting on action, eyeline match, the 180-degree rule — all keep the audience from getting lost in space and time. Eisenstein's montage tradition did the opposite, exposing the seams to create collision and meaning. The editor chooses, case by case, to hide the seams or show them.

Editing is also an art of time. Shorter cuts raise tension; longer ones give the audience room to think. Cuts in ads and short-form speed up not just to pack in information but to keep catching the viewer's attention afresh.

Digital nonlinear editing made everything undoable, but it does not supply judgment. Even while learning the software, make a habit of asking at every cut, 'What is the audience feeling now?' Further reading: Walter Murch, In the Blink of an Eye; Ken Dancyger, The Technique of Film and Video Editing.

PART 05 Editing and post-production

5.1 History of editing tools

Tools went from film scissors to generative AI; the skeleton of the work barely changed.

Reference photos 5.1A Generated images — the splicing era

a

Splicer — a tool that physically cuts film and joins it with tape or cement. We still call the unit of editing a 'cut' after this physical act of cutting film with scissors.

b

Flatbed editor — a horizontal table such as the Steenbeck, where film was wound back and forth to find the cut point. The feel for counting frames by fingertip was trained here.

EDL

Edit decision list. The reference document for rebuilding offline edit decisions in high quality during the online.

Period	What changed
1920s	Physical editing: cutting and splicing film by hand. Editors wound film on the Moviola and Steenbeck to find points and counted frames by fingertip.
1956–	Videotape arrives. Editing shifts to linear assembly, copying between two decks.
1970–80s	Timecode standardized, EDL introduced. The 2-stage method takes hold: decide offline, rebuild in high quality online.
1989	Nonlinear editing systems go commercial. With random access, editing becomes a thinking job of rearranging material.
1991–1999	Desktop editing software arrives in waves. The personal computer becomes the cutting room and entry costs plunge.
2000s	HD transition, more codecs. Proxy editing goes mainstream.
2010s	Cloud collaboration, auto color matching, GPU acceleration. A pro grading tool goes free and color correction becomes a common skill.
2020s	Mobile editing apps, auto captions, auto cutting. Generative AI joins as an editing assistant; the 1st rough cut is being automated while people focus on judgment.

Habits from history

The old split between offline and online lives on in today's proxy editing. EDLs and timecode are still the basis of collaboration, and the Moviola-era feel for frames still marks a good editor.

Exercise
5.1

Task Make two versions of the same scene: joined strictly in order, as in the Moviola era, and edited nonlinearly.

Tip Set a rule: no undo in the in-order version.

Assessment How the method shapes working attitude

Model answer Log both methods' working time and results.

PART 05 Editing and post-production

5.2 Basic editing principles

Cut not because it's dull but when the next cut offers better information.

Note Nonlinear editing — with instant access to any point, editing changed from 'cutting' to 'thinking by choosing and arranging'

Read the timeline in four rows

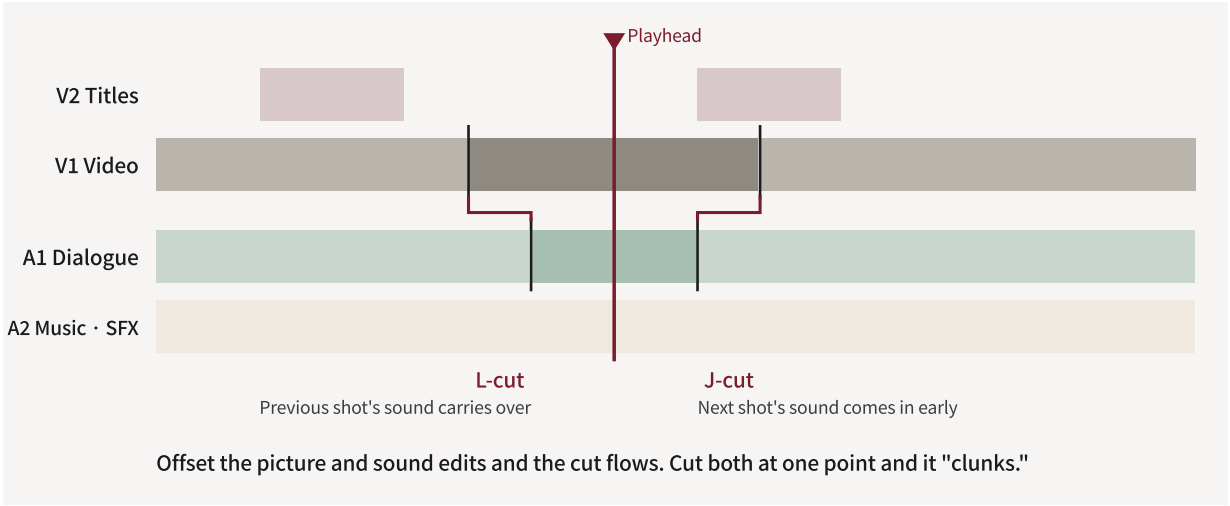

Figure 52 Structure of an editing timeline — the top two rows are "what you see," the bottom two "what you hear." J- and L-cuts put the sound edit before or after the picture edit.

TIP

01 Cut only for a reason: when the next cut gives better information.

Lay sound first. Set the timing of music and dialogue, then lay picture on top, and the finish improves.

02 Cut mid-action. Cut after the action ends and the rhythm sags.

03 Lay sound first. Set the music and dialogue timing, then add picture.

04 Change size and angle together. Change only one and it looks like a jump.

05 Keep eyelines. If a character looking left looks right in the next cut, the relationship breaks.

06 Throw out boldly. Keep a shot just because it was hard won and the video drags.

07 Lock the opening and ending first. Once they are set, the middle sorts itself out.

08 Rewatch a day after finishing. Slack you couldn't see that day will show.

> Keep the cuts you need, not the good ones.
>
> 5.2 Basic editing principles

Exercise 5.2

Task	Cut 3 minutes of footage to 1 minute. List what you threw out.
Tip	Keep the cuts you need, not the good ones. Start each cut mid-action.
Assessment	Clarity of story, natural cut points
Model answer	Walter Murch's editing priorities (emotion, story, rhythm). One line on why each cut was dropped.

PART 05 Editing and post-production

5.3 Comparing editing software

For jobs, knowing two tools deeply beats knowing three shallowly.

Note

Check first: CapCut's commercial-use terms, and Final Cut's Mac-only status and collaboration limits.

Tool	Strengths	Weaknesses	Best for	Pricing
Premiere Pro	Versatility, After Effects link, Korean hiring standard	Uneven stability, corrupted projects	Ads, web video, most pro work	Subscription
Final Cut Pro	Speed, stability, magnetic timeline	Mac only, limited collaboration	Solo creators, Mac users	One-time purchase
DaVinci Resolve	Top-tier grading, strong free version	Learning curve, high specs	Color-centric, no-budget work	Free + paid edition
After Effects	Compositing, motion graphics, 3D space	Unsuited to cutting	Titles, VFX, infographics	Subscription
CapCut	Auto captions, templates, mobile sync	Check commercial-use terms	Short-form, quick jobs	Free + paid
Vrew	Speech-to-text captions, silence removal	Limited precision	Lectures, interviews, explainers	Free + paid
Avid Media Composer	Large teams, broadcast standard	High entry barrier	TV drama, broadcasters	Subscription

What to learn first

Korean job postings most often ask for Premiere Pro plus After Effects. Add DaVinci Resolve to go deep into color, or CapCut if you turn out a lot of short-form.

Exercise 5.3

Task	Do the same 10-cut edit in two editing programs and compare the workflows.
Tip	Focus the comparison on shortcuts and project structure.
Assessment	Specific comparison points, reasons for your choice
Model answer	Tabulate recommended tools by use (short-form, ads, features).

PART 05 Editing and post-production

5.4 Premiere Pro at a glance

Know each panel's role and have a map of when the 20 features are needed, and one search solves any problem.

TIP

Splitting bins by shoot day, scene, music and graphics is a habit that sets your editing speed.

Workspace layout

Manage

Project panel

- The drawer for source files
- Bins by shoot day · scene · music · graphics

Review

Source monitor

- View raw clips, set in · out points
- Screen clips here before the timeline

Review

Program monitor

- The window showing your edit
- Keep safe-area guides and margins on

Edit

Timeline

- Where the actual editing happens
- Video tracks stack up, audio tracks down

Effects

Effects panel · Effect Controls

- Transitions and effects; favorite the ones you use often
- Adjust position · scale · rotation · opacity and effect values, add keyframes

Color

Lumetri Color

- Dedicated color panel
- Basic Correction, Creative, Curves, Color Wheels, HSL Secondary, Vignette

Graphics

Essential Graphics

- Titles and graphics templates
- Load a motion graphics template and change only the text

Sound

Audio Track Mixer

- Volume and pan per track
- Manage audio effects

Sound

Essential Sound

- Tag as dialogue · music · SFX · ambience for auto processing
- Dialogue noise reduction, loudness normalization

20 features you must learn

Feature	What it does	When to use
Sequence settings	Set resolution, fps, aspect ratio	First thing in a new project
Create proxies	Edit with light stand-ins	4K-plus footage, low-spec PC
Multicam editing	Sync several cameras and switch	Events, interviews, shows
Audio sync	Auto-sync by waveform	With an external recorder
Ripple edit	Trim and what follows closes up	Whole rough cut
Rolling edit	Moves only the edit point	Fine-tuning timing
Slip and slide	Change content or position, same length	Swap content, keep rhythm
Markers	Flags and notes on the timeline	Applying feedback, marking beats
Nesting	Groups clips into one	Effects on a group
Adjustment layer	Effects on all clips below at once	Overall grade, grain
Speed change	Slow, fast, reverse	Slow motion, time-lapse
Time interpolation	Frame blending, optical flow	Smooth slow motion
Masks and tracking	Effects on one area only	Blurring faces, hiding logos
Warp Stabilizer	Removes shake	Handheld shots
Lumetri LUTs	Converts log footage	Grading step 1
Color Match	Auto-matches two shots' color	Shots from different cameras
Auto captions	Captions via speech recognition	Interviews, explainers

Feature	What it does	When to use
Essential Graphics templates	Reuse recurring title styles	Series content
Relink offline media	Reconnect sources with broken paths	After moving folders
Project Manager	Collects only the media used	Backup, vendor handoff

Common shortcuts

Shortcut	Function	Shortcut	Function
C	Razor tool	V	Selection tool
A	Track select forward	B	Ripple edit tool
I / O	In / out point	Space	Play and stop
Q / W	Ripple trim previous / next	M	Add marker
Ctrl+K	Cut at playhead	Shift+Delete	Ripple delete
J / K / L	Reverse / stop / play	Arrow keys	Move 1 frame
Ctrl+M	Export	Ctrl+S	Save

Exercise 5.4

Task Finish a 1-minute video in Premiere Pro: cutting, captions, audio cleanup, color and export.

Tip Match the sequence settings to the source and set up shortcuts early.

Assessment Tidy timeline, output specs met

Model answer Split tracks by role (dialogue, SFX, music) and color-label them.

PART 05 Editing and post-production

5.5 After Effects at a glance

After Effects is not a cutting tool but one for stacking, moving and compositing elements within a single frame. Premiere handles time horizontally; After Effects handles layers vertically.

Edit in time, composite in layers

6 **Camera** — virtual camera — views every layer

5 **Light** — shadow and brightness for 3D layers only

4 **3D text** — letters with depth — sides show as the camera turns

3 **Person (keyed)** — footage, background removed

2 **Midground** — graphics · gradient — depth

1 **Background plate** — bottom — base footage

The top layer is the front of the frame. Reorder and what is hidden changes — edit in time, composite in layers.

Figure 53 The After Effects layer stack — six layers stacked bottom to top. Camera and light are not images but "ways of viewing the layers."

P · S · R · T

Position, scale, rotation, opacity. Shortcuts that call up the five basic keyframe properties.

Key concepts

Unit

Composition

- The unit canvas. Resolution · frame rate · duration are fixed here
- Check first — set it wrong and you redo everything

Element

Layer

- Upper layers cover lower ones
- Footage, solid, text, shape, camera, light, null

Motion

Keyframe

- Marks when a value changes
- Basics: position · scale · rotation · opacity, shortcuts P S R T

Wrap

Pre-compose

- Bundles several layers into one
- Key to controlling effect order

Cutout

Track matte

- Cuts out by another layer's shape (alpha) or brightness (luma)
- Used constantly to mask 3D text

Hierarchy

Parenting

- Ties one layer to another so they move together
- Parent to a null to drive complex motion as one

Math

Expressions

- Values by formula: loops · wiggle · links without keyframes
- wiggle and loopOut are the starter essentials

Features by category

Category	Main features	Practical use
Text	Text animators, Source Text, path text	Titles, caption motion, copy reveals
Shapes	Shape layers, Trim Paths, Repeater	Infographics, line animation, shape transitions
Masks	Pen masks, mask feather, mask expansion	Partial reveals, transitions
Roto	Roto Brush, Refine Edge	Isolating people when chroma key is impossible
Keying	Keylight, Spill Suppressor, Advanced Spill	Green-screen compositing
Tracking	2D point, corner pin, 3D Camera Tracker, Mocha	Pinning elements, screen swaps
3D	3D layers, cameras, lights, shadows, depth of field	3D titles, spatial staging
Puppet	Puppet pins, Starch tool	Animating illustrated characters
Time	Time remap, Force Motion Blur, Pixel Motion	Retiming, speed ramps
Color	Lumetri Color, Curves, Color Balance	Matching element color
Effects	Glow, blur, displacement, Fractal Noise	Light, distortion, texture
Output	Render Queue, Media Encoder link	Output with alpha, final delivery

Working order for 3D text and lighting

TIP

Match the camera's focal length to the live-action lens, or the perspective won't line up.

01 Choose the typeface. Tight tracking makes faces collide in 3D extrusion, so track wide and go bold.

02 Make the text layer 3D and set extrusion depth. 15–30% of letter height is safe.

03 Set the material. Metal: reflections and highlights; matte: mostly diffuse.

04 Add a camera. Match its focal length to the live-action lens.

05 Place lights. Check the shadow direction in the footage and set the key light at the same angle.

06 Make a floor layer to catch shadows. Without it, the text looks like a sticker floating in air.

07 Add motion. By default, ease out for entrances, ease in for exits.

08 Turn on motion blur and match the grain to the live action.

Easing (accel · decel) reference values

Easing

The acceleration · deceleration curve of a move. Linear is mechanical; Easy Ease slows going in and out. Shape it as a speed curve in the Graph Editor.

Easing type	Feel	Use for	Frames at 24fps
Linear	Mechanical, lifeless	Endless loops, spinning BGs	-
Ease out	Arrives fast, settles softly	Entrances	10–15 frames
Ease in	Starts slow, speeds away	Exits	8–12 frames
Ease in-out	Most natural	Most moves	12–18 frames
Overshoot	Passes the target, comes back	Lively logo reveals	15–20 frames
Bounce	Bounces to rest	Casual, kids' content	20–25 frames

Motion graphics fix-up order

01

Apply easing

No right-angle breaks in the speed curve

02

Add anticipation

Move the opposite way first

03

Separate follow-through

Let attached parts trail behind

04

Push exaggeration

Bigger than life

Apply just these four steps in order and the beginner look disappears. A speed curve that bends at a right angle in the Graph Editor always looks awkward, so smooth it out.

What recent updates changed

Note

Feature names and behavior change between versions. Before the exercise, check the what's-new notes for your installed version.

Roto

Roto Brush 3.0

- AI-model Roto Brush. Rough strokes on one frame track even hair · soft edges
- Now the standard tool for isolating people shot without chroma key

3D

Advanced 3D renderer

- Import .glb · .gltf · .obj · .fbx 3D models straight into a composition
- 3D lights, shadows and environment light that blend with live action

Camera

3D camera · null object

- Parent the camera to a null to drive dolly · orbit · push-in from one property
- Text · models · flat layers share one perspective in one space

Keying

Keylight + Key Cleaner · Advanced Spill Suppressor

- Pull the primary key with Keylight, clean edges with Key Cleaner
- Remove green spill on skin with Advanced Spill Suppressor. Stacking the three in order is the basic set

Properties

Properties panel · Essential Properties

- A selected layer's common properties in one panel, editable without opening the timeline
- Essential Properties expose values inside a precomp so each copy can differ

Integration

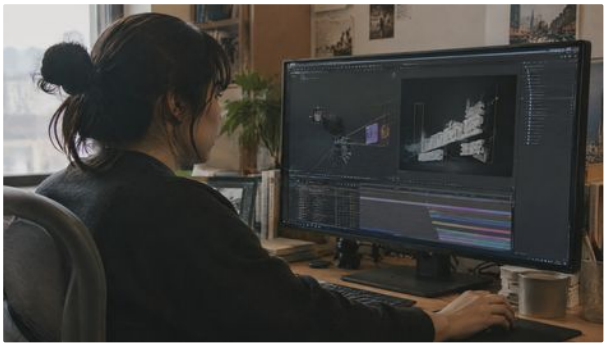
Dynamic Link · Text-Based Editing · Generative Extend

- Dynamic Link places AE compositions on the Premiere timeline without rendering
- Premiere's Text-Based Editing (cutting from the transcript) and Generative Extend (generating extra length at clip ends) speed up cutting

Reference photos 5.5A Generated images — compositing and motion graphics

a

Roto · keying · compositing — separation (roto · key), cleanup (spill removal) and background color matching are one set



b

Motion graphics work — design camera moves with a 3D camera and null object, and apply easing to text layers

Exercise 5.5

Task	Make a 5-second logo-reveal motion graphic in After Effects.
Tip	Adjust ease in · ease out in the Graph Editor.
Assessment	Acceleration and deceleration, fit with the brand tone
Model answer	Compare linear and curved versions side by side.

Background 8

The illusion of life — origins of the animation principles

How to breathe weight, character and emotion into still drawings was worked out over decades of trial and error. The principles of animation are physics and acting theory at once.

In 1914, Winsor McCay's Gertie the Dinosaur showed a character taking orders and reacting before an audience, proving animation could create a being with personality. Preparing Snow White and the Seven Dwarfs (1937), the Walt Disney Studio had its animators observe real animals and people in motion and taught them drawing and anatomy.

Disney's core animators of the era were called the 'Nine Old Men.' Two of them, Frank Thomas and Ollie Johnston, distilled the studio's principles into twelve in The Illusion of Life (1981): squash and stretch, anticipation, staging, pose to pose, follow-through, slow in and slow out, arcs, secondary action, timing, exaggeration, solid drawing, appeal. These are less rules than ways of translating observed reality so the audience feels it more.

Half the principles are physics. A ball squashing as it lands and stretching as it bounces, a heavy object starting and stopping slowly — these make mass and inertia visible. The other half is acting. Anticipation signals the next action, exaggeration clarifies emotion, and appeal makes the audience give their heart to the character.

In 1987, Pixar's John Lasseter presented "Principles of Traditional Animation Applied to 3D Computer Animation" at SIGGRAPH. His point: the tools changed from pencil to computer, but how audiences sense life in motion did not. A motion designer easing a logo in the Graph Editor today follows the same principles.

Before memorizing the principles, build the habit of watching movement around you. An eye for the order in which a person rises from a chair or a ball rolls down stairs makes the principles living tools. Further reading: Frank Thomas · Ollie Johnston, The Illusion of Life; Richard Williams, The Animator's Survival Kit.

PART 05 Editing and post-production

5.6 The 12 principles of animation

Twelve principles, applied to advertising. Half are physics, half acting. Fix easing · anticipation · follow-through · exaggeration in that order and the beginner look disappears.

The 12 principles — movement through one character

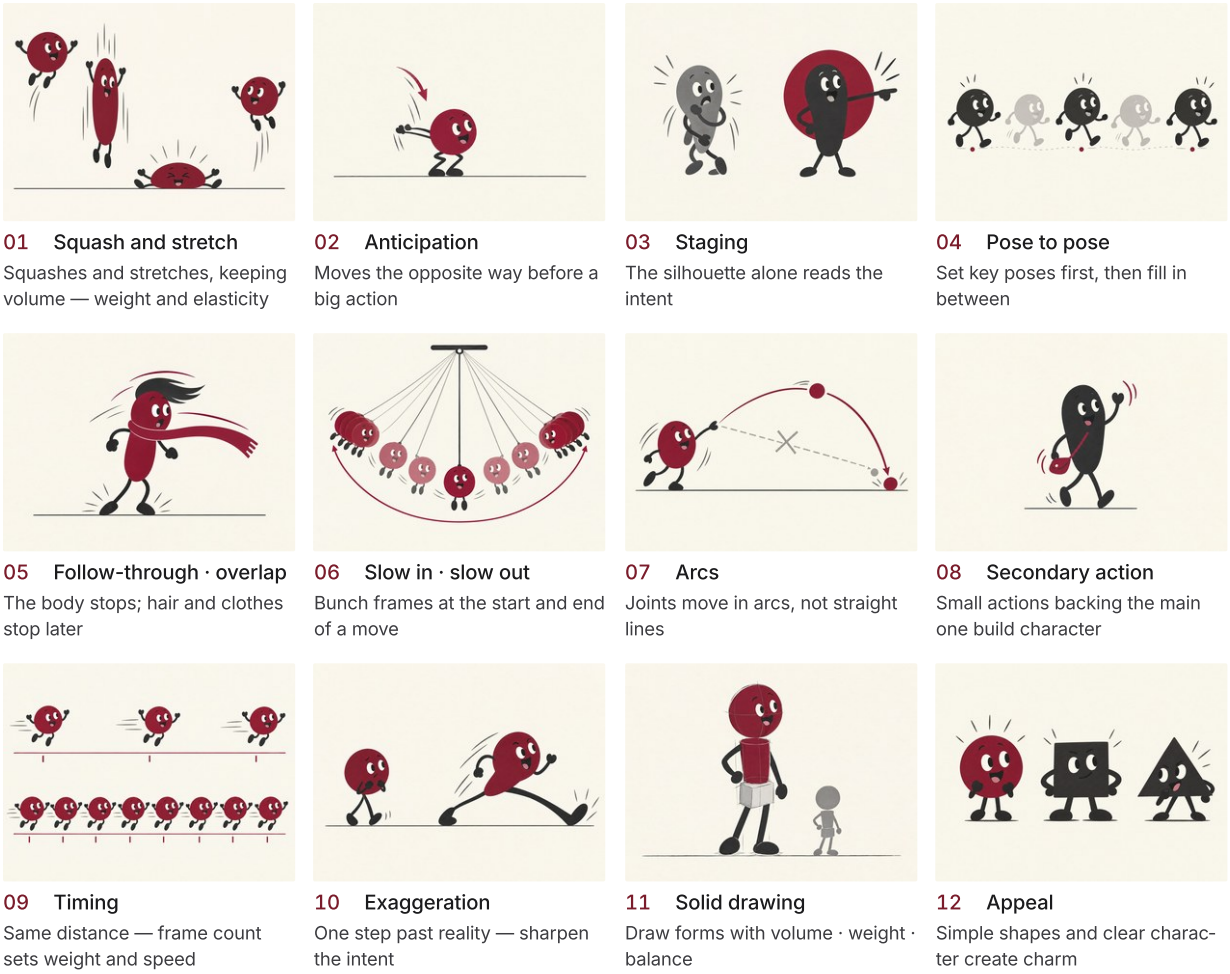


Figure 54 The 12 principles of animation — twelve rules of movement on one character (Disney, 1981). Red lines mark the "movement" each principle points to.

One bouncing ball holds four principles

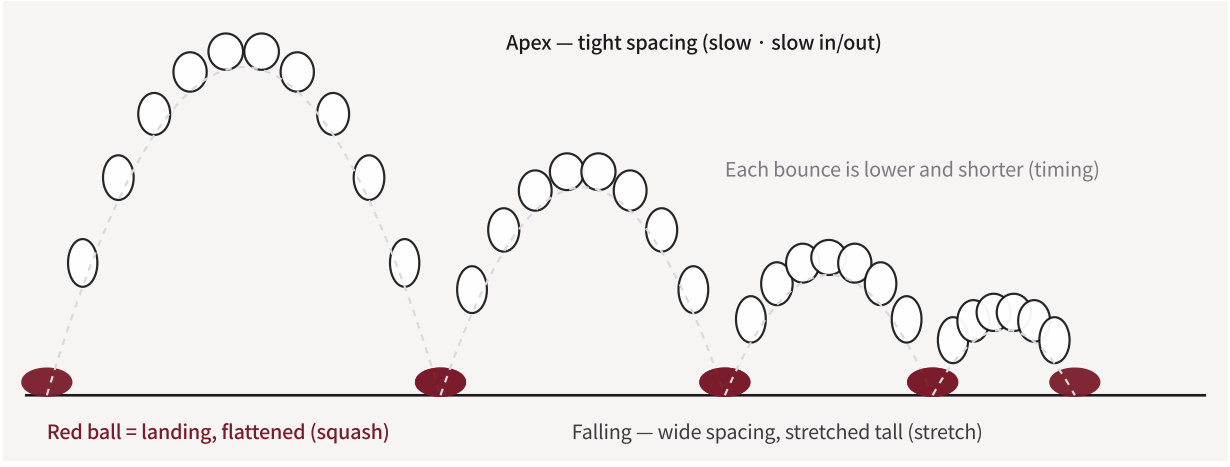

Figure 55 The bouncing ball — arcs · timing · spacing · squash and stretch, all in one ball. Balls are drawn at equal time intervals: slow and tight at the apex, fast and sparse near the floor. The red ball is the moment it hits the floor (squash).

Same distance and frames — spacing alone makes a different motion

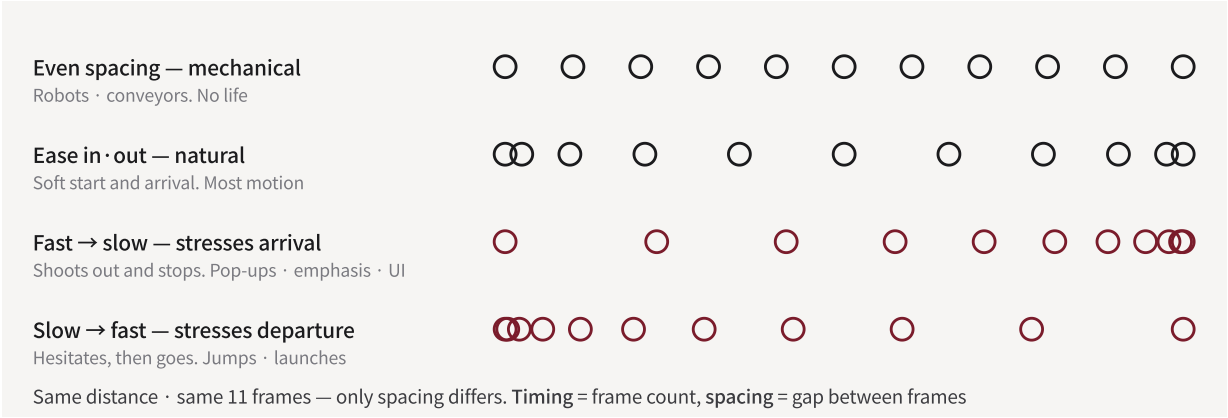

Figure 56 Timing and spacing — every row covers the same distance in the same number of frames. Where circles are far apart, the motion is fast.

TIP

Key poses first, then fill the in-betweens. Draw the spacing chart first.

The twelve principles — as scenes from a stop-motion short

01

Squash and stretch

Squashes and stretches, keeping volume — weight and elasticity

02

Anticipation

Moves the opposite way before a big action

03

Staging

The silhouette alone reads the intent

04

Pose to pose

Set key poses first, then fill in between

05

Follow-through · overlap

The body stops; hair and clothes stop later

06

Slow in · slow out

Bunch frames at the start and end of a move

07

Arcs

Joints move in arcs, not straight lines

08

Secondary action

Small actions backing the main one build character

09

Timing

Same distance — frame count sets weight and speed

10

Exaggeration

One step past reality — sharpen the intent

11

Solid drawing

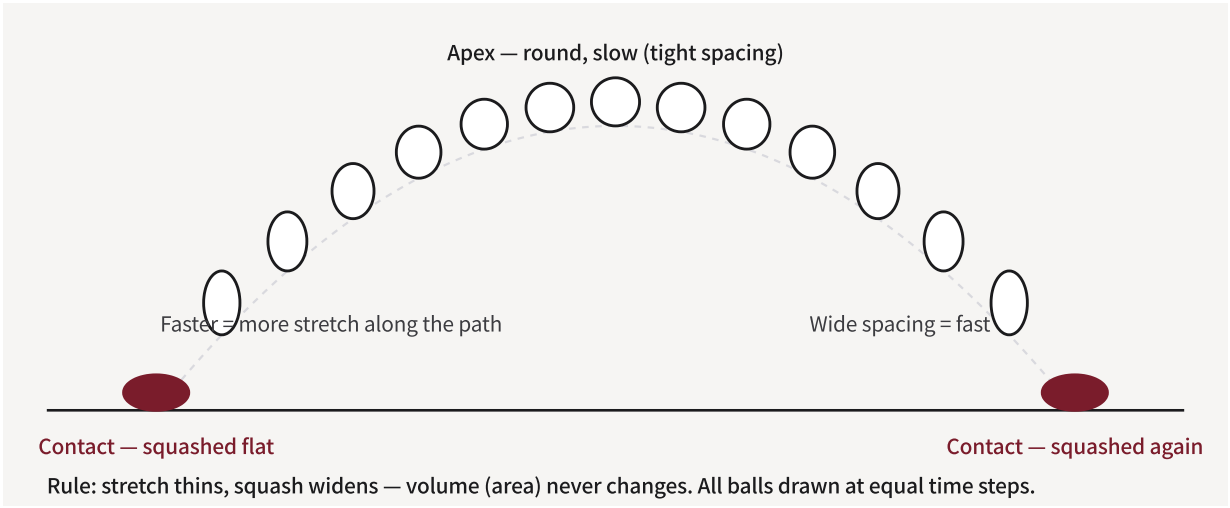
Draw forms with volume · weight · balance

12

Appeal

Simple shapes and clear character create charm

Squash and stretch — a bouncing ball in sequence



G-15 Squash and stretch — one parabola of a bouncing ball. Round and tight at the apex, longer and sparser as it falls, flat the instant it lands. The ball's area is the same in all fifteen drawings.

Exercise
5.6

Task	Animate, in order: a bouncing ball, a heavy ball · a light ball, a character jump.
Tip	Key poses first, then fill the in-betweens. Draw the spacing chart first.
Assessment	Use of squash · timing · arcs
Model answer	The 12 principles from Disney's The Illusion of Life. Compare the same jump by two characters of different weight.

PART 05 Editing and post-production

5.7 Compositing and keying in practice

Judge keying in six steps; when a composite shows, look to three causes: black level · atmospheric perspective · grain.

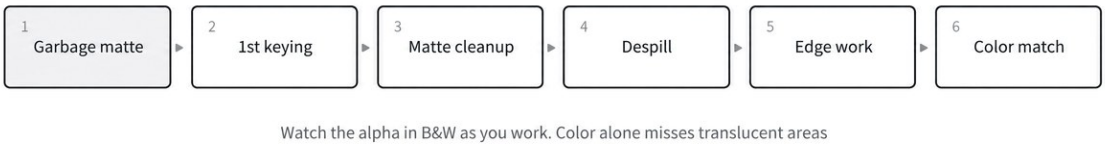


Figure 57 The 6 steps of keying — garbage matte › primary key › matte cleanup › spill removal › edge treatment › color matching

Step	What to do	Criterion
Garbage matte	Mask out what lies outside the green	Light stands and floor edge removed
Primary key	Key out the screen color	Hair still intact
Matte cleanup	Clean up viewing alpha in black and white	Subject pure white, background pure black
Spill removal	Remove green on skin and clothes	Skin hasn't turned gray
Edge treatment	Choke and feather edges	No jaggies when zoomed in
Color matching	Match background color and brightness	Light direction, color temp match

Three reasons a composite shows

Cause 1

Black level

- If an element's blacks are darker than the live action, it jars at once
- Lift the blacks slightly

Cause 2

Atmospheric perspective

- Distance lowers contrast and mixes in background color
- Lower saturation and contrast with distance

Cause 3

Grain and noise

- Live action has noise; CG has none
- Add matching grain to the elements

Final check

Shrink the image or switch to black and white. Mismatches show more on a small screen and in black and white.

G-16 Before and after compositing — chroma key source and final frame · GPT-generated image, for concept only

Exercise 5.7

Task	Composite one scene from a chroma key source and a background plate.
Tip	After keying, refine in order: edges, spill, shadows, color match.
Assessment	Edge quality, matched light and color
Model answer	Submit a before-and-after comparison with the layer structure.

PART 05 Editing and post-production

5.8 Color grading

Sort out brightness before touching color. The look starts only after primary correction.

Note Color grading suite — set brightness first by the scopes, not the eye, then apply the look

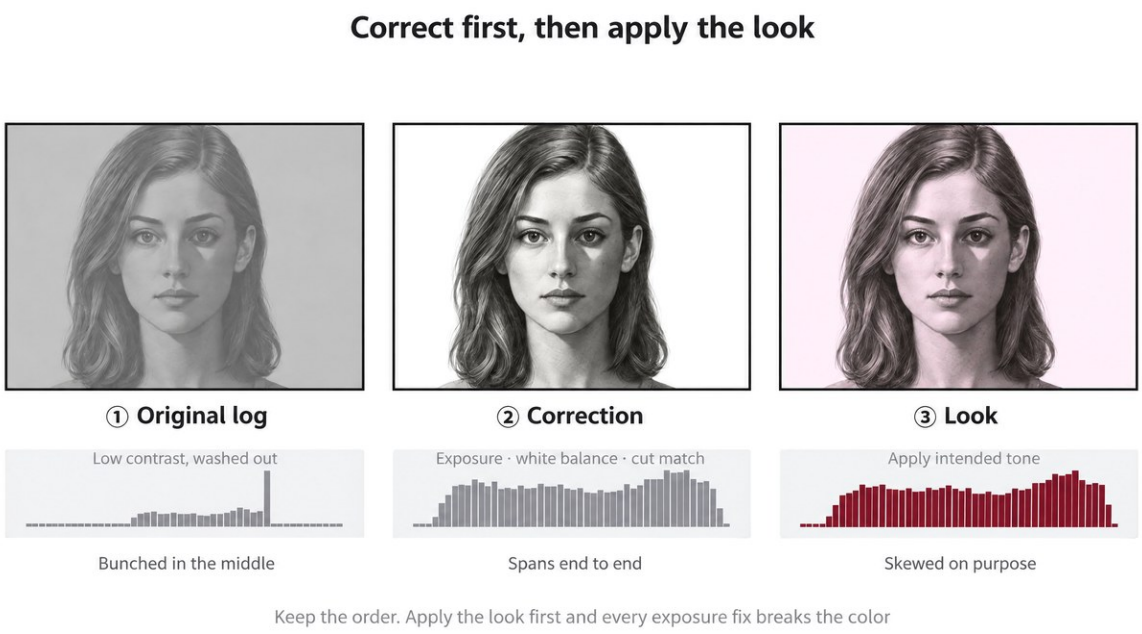

Figure 58 Tonal change at each grading stage

Working order

01	02	03	04	05	06
Exposure · contrast	**White balance**	**Shot matching**	**Look**	**Secondaries**	**Check output**
Brightness before color	Make gray look gray	One scene, one time of day	Only now is the color decided	Just faces, sky, product	On monitor, smartphone, TV

Basic look

Cool shadows, warm highlights. Skin tones are most sensitive to gamma.

Tool	What it adjusts	Note
Lift	Shadows	Too much and the image goes milky
Gamma	Midtones	Skin tones react most
Gain	Highlights	Highlights clip easily
Curves	Precise control by range	An S-curve is the basic contrast boost
HSL secondary	Adjusts selected colors only	Essential for skin correction
Color wheels	Tints by tonal range	Cool shadows, warm highlights: the basic look

G-17 Color grading — log original and two looks · GPT-generated image, for concept only

Exercise
5.8

Task Create two different looks for the same footage and explain the emotion of each.

Tip Finish primary correction (exposure, white balance) before moving to secondaries. Watch the scopes.

Assessment Skin tones preserved, consistent look

Model answer Match the look to a reference still and attach scope captures.

PART 05 Editing and post-production

5.9 Mobile and automated editing tools

Automated output is a draft. Deliver it unchecked and you lose trust in one go.

Note

For commercial use, check the license scope of templates and music, and never clone a real person's voice without permission.

Short-form

CapCut

- Templates, auto captions, beat sync, background removal
- Efficient for short-form at volume
- Commercial use: check template · music licenses

Captions

Vrew

- Auto captions from speech, batch silence removal
- 1st rough cuts of lectures, interviews, explainers
- A person checks proper-noun errors

Voice

Typecast

- Text to speech
- Draft narration, multilingual dubbing
- No unauthorized cloning of real voices

Generative

Runway and similar

- Video from text and images, background removal
- Stand-ins for inserts you can't shoot

3D

Meshy

- Turns images into 3D models
- Prop · character prototypes, rigging and animation previews

Image

Photoroom and similar

- Auto background removal, retouching
- Product shot cleanup

Rules for automation tools

Proper nouns in auto captions, the pacing of auto cuts, fingers and lettering in generated video: a person always checks these.

Exercise 5.9

Task	Using a mobile editing app and automation, turn the same source into short-form in under 15 minutes.
Tip	Always proofread auto captions.
Assessment	Balance of speed and quality, fixes to automated output
Model answer	List what a person fixed in the auto-edited result.

PART 05 Editing and post-production

5.10 Output specs and delivery

Codecs differ by purpose, and common output problems have known causes.

Note Delivery and backup — keep exports on two separate media and tick off the specs on a checklist

TIP

Tabulate resolution, bitrate, loudness (LUFS) and file-naming rules before exporting.

Output specs by purpose

Purpose	Codec / format	Key settings
To editing software	ProRes 422 HQ	Default when no alpha is needed
Intermediate with alpha	ProRes 4444 or PNG sequence	Enable the alpha channel
Online upload	H.264 mp4	40–60Mbps for 4K
Screening, exhibition	ProRes 422 HQ or uncompressed	Check loop start and end frames
Outdoor LED	Media operator's spec	Confirm resolution and frame rate in advance
Archive	Keep the original codec	Keep project files with the sources

Fixes by symptom

Symptom	Cause	Fix
Very slow rendering	High-res sources, stacked effects	Proxies, pre-renders, fewer effects
Rough text edges	Continuous rasterization off	Turn that option on
Colors look different	Mismatched color management	Lock the project color space
Composite jitters	Unstable tracking data	Re-track, apply smoothing
File won't open	Codec not installed	Re-export in a common codec
Audio too quiet	Loudness not adjusted	Normalize to platform loudness

Exercise 5.10

Task Export the same video in three specs: YouTube, Instagram Reels and theatrical screening.

Tip Tabulate resolution, bitrate, loudness (LUFS) and file-naming rules first.

Assessment Spec compliance, file management

Model answer Make your own delivery checklist and attach the results for each export.

PART 05 Editing and post-production

5.11 Expressions and automation

Advanced After Effects. Expressions compute values without keyframes. You needn't know the syntax: learn just five and your working time drops sharply.

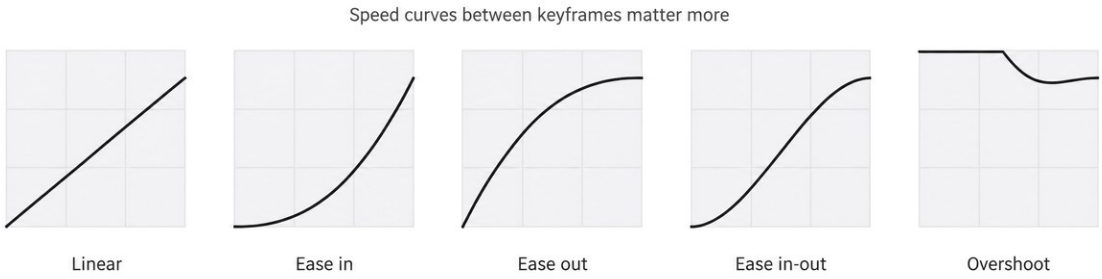

Figure 59 5 easing curves

Expression	Role	Examples
wiggle(freq, amp)	Random shake	Handheld feel, glitches, jitter
loopOut()	Loops a keyframed section endlessly	Spinning logos, looping BGs
time * value	Value changes with time	Steady rotation, scrolling
linear(t, a, b, c, d)	Maps one value's change onto another	One slider drives several properties
Parenting (pick whip)	Takes another property's value as is	Controls many elements as one

Habits that speed up your work

- Save setups you use often as animation presets and reuse them.
- Turn a null object into a controller so one slider adjusts several values.
- Always name your layers. Even you won't understand 40 unnamed layers the next day.
- Sort layers by color label. Text, background, effects, camera — each a different color.
- Use the project cleanup tools to remove unused footage regularly.

Note

Precompose freely, but 3 or more levels of nesting become harder to manage.

Linking Premiere and After Effects

01	02	03	04	05
Lock the cut	**Replace with comp**	**Work · save**	**Render with alpha**	**Final export**
In Premiere. If the cut changes, compositing is wasted	Turn the clip into an AE comp; changes update automatically	Just save in AE and the timeline updates	When it gets heavy, render a file with alpha and lay it back in	From Premiere in one pass. Intermediates in a high-quality codec

Exercise 5.11

Task	Use expressions to make text that shakes on its own and a number counter that changes over time.
Tip	Start with the wiggle, time and linear expressions.
Assessment	Understanding of expressions, reusability
Model answer	Builds a template whose values can be adjusted with slider controls.

PART 05 Editing and post-production

5.12 DaVinci Resolve features

The standard tool for color correction, and an integrated environment that also handles editing, compositing and sound. Even the free version covers most commercial work.

TIP

Trust measurement over your eyes. Check the numbers on the waveform, parade and vectorscope.

Seven pages

Page	Role	Key features
Media	Managing and organizing footage	Importing clips, metadata, proxy generation
Cut	Fast rough cut	Source tape, smart editing tools
Edit	Precision editing	Timeline, transitions, subtitles, speed changes
Fusion	Compositing and motion graphics	Node-based compositing, tracking, particles
Color	Color correction	Nodes, curves, qualifiers, power windows, tracker
Fairlight	Sound	Mixer, audio effects, loudness meter
Deliver	Output	Codec presets, batch rendering, per-platform versions

Key tools on the Color page

Structure

Nodes

- Chains correction steps as blocks you can toggle separately
- Serial, parallel and layer nodes

Color pick

Qualifier

- Selects and corrects one specific color
- For adjusting only skin tones or sky

Area

Power window

- Corrects only a chosen area of the frame
- With the tracker, it follows moving subjects

Precision

Curves

- Fine-tunes brightness and color range by range
- An S-curve is the basic contrast boost

Auto

Shot match

- Matches the color of two shots automatically
- A starting point when cutting between different cameras

Measurement

Scopes

- Waveform, parade, vectorscope
- Trust measurement over your eyes

Example color node setup

01
Technical transform
Log to standard

02
Exposure · contrast
Set the brightness

03
White balance
Make gray gray

04
Shot matching
One scene, one time of day

05
Apply the look
Set the film's color

06
Skin tones
Local fix with a qualifier

07
Sky · background
Local fix with a power window

08
Vignette · grain
Finishing touches

Exercise
5.12

Task	In DaVinci Resolve, build a correction pipeline of 3 or more nodes.
Tip	Give each node just one job (exposure, color, look).
Assessment	Logic of the node structure, quality of the result
Model answer	Names each node and submits comparison stills with each node toggled on and off.

PART 05 Editing and post-production

5.13 Types of animation

Animation is divided by what each frame is made from, and broadly splits into 2D and 3D. Change the material, and the texture of the motion and the way it is made change with it.

Methods differ by what makes each frame

Cel animation
Drawn on clear cels, layered over a background

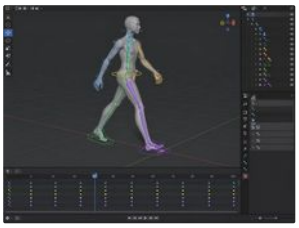
Cutout
Jointed paper moved a little at a time

Sand animation
Sand spread over light, frame by frame

Pixilation
People shot frame by frame like puppets

Paper drawing
One frame per sheet, checked by flipping

Clay · stop-motion
Physical puppets moved bit by bit and shot



3D CG
You move the rig; the computer calculates

Rotoscope
Traced over live action, one frame at a time

Figure 60 Eight methods of animation — change the material and the texture of motion and the production method change with it. From top left to bottom right, the work moves from "drawing" to "computing."

Features of each method

Cel
Cel animation

- Characters drawn on clear celluloid, shot layered over backgrounds
- The standard for commercial features; the origin of digital layers

Cutting
Cutout

- Figures cut from paper or cloth, joints pinned, moved bit by bit and shot
- Lotte Reiniger's The Adventures of Prince Achmed (1926); now done with digital puppets

Sand
Sand animation

- Sand on a lightbox pushed by hand into new shapes and shot
- Known for morphing: one shape flows into the next scene

People
Pixilation

- People shot one frame at a time like puppets
- Unreal motion — gliding or floating in midair; Norman McLaren's Neighbours (1952)

Paper

Paper · drawing

- The most basic method: drawing on paper, one sheet at a time
- A flipbook shows the principle most simply

Clay

Clay · stop-motion

- Clay or jointed puppets moved bit by bit on a set and shot
- The handmade feel of materials and real light survives intact

Computer

3D CG

- A skeleton (rig) goes into the model, which is keyframed, then rendered
- Toy Story (1995) was the first fully CG feature

Tracing

Rotoscope

- Live-action footage traced frame by frame
- For carrying realistic motion into a drawn texture

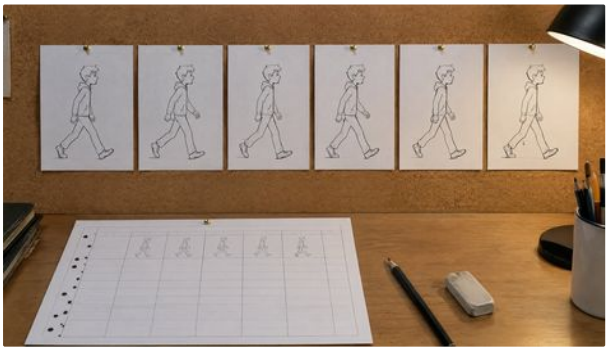
Reference photos 5.13A Generated images — three materials that make a frame

a Drawing — draw the key poses first, then fill in the in-betweens

b Stop-motion — the texture of real light and materials stays intact

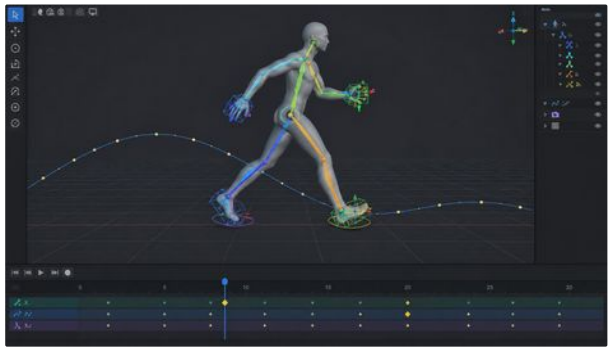
c 3D — keyframe the rig and refine the easing in the graph editor

2D draws motion; 3D designs motion, then computes it



2D — drawn one by one

One drawing = one frame. The next is drawn over the original · line · color · motion come from one hand · revising means redrawing



3D — the model is moved

Build a rig (skeleton), then set only poses = keyframes · the computer calculates the in-betweens · camera · lighting · materials change separately · revising means changing values

How to choose — 2D if you need a handmade feel and exaggeration; 3D if the camera moves around and the same character must work from many angles · in many episodes. In practice the two are mixed (3D with a 2D look, 2D characters on 3D backgrounds).

Figure 61 2D and 3D — drawings that make motion versus motion by design. Left: sequential frame drawings; right: a 3D viewport showing a rig and keyframes.

How 2D and 3D differ

2.5D

3D dressed in a 2D texture. A hybrid that is growing more common.

Aspect	2D	3D
Unit of work	A new drawing for every frame	Build the model once, then change poses and camera
Space	Depth shown through drawn perspective	Depth exists in virtual space; the camera can go anywhere
Revisions	Changing a form means re-drawing it	Fix the model and rig and every shot updates; high setup cost up front
Expression	Free line and exaggeration	Realistic volume · lighting · materials
In advertising	Motion graphics, character ads	Product demos, explaining structure. In reality, mixing is most common

A sentence to use on set

When choosing a method, first decide what texture you want to be remembered for. Budget and schedule come second.

Reference photos 5.13A Generated images — directing reference

a Cel animation — painted on clear cels

b Cutout animation — moving cut-out pieces

c Sand animation — scenes drawn in sand

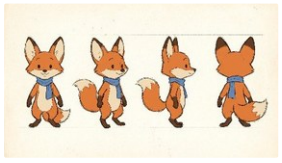
Reference photos 5.13B Generated images — directing reference

a Pixilation — people shot frame by frame

b Paper · clay stop-motion

c 3D CG — characters in virtual space

Reference photos 5.13C Generated images — directing reference



a 2D — drawing in line and plane

b 3D — volume and light

c 2.5D — 3D with a 2D texture

Exercise
5.13

Task	Make the same 5-second action twice: once as 2D cel, once as 3D or stop-motion.
Tip	Log your hours. They are the most realistic basis for choosing a method.
Assessment	Understanding of each method's traits and production cost
Model answer	Attaches a production timesheet to the results, turning them into a guide for choosing a method.

PART 05 wrap-up

Exercises and review

01 Edit it twice

Edit a 30-second video twice from the same footage: once laying the music first, once cutting the picture first. Compare the results.

02 Three entrances

In After Effects, bring in one line of text three ways — linear, ease out, overshoot — and compare.

03 Before and after color

Make a comparison video showing the same shot before and after color correction, side by side.

04 Check auto subtitles

Generate subtitles for a 1-minute interview with an auto-captioning tool and count the errors.

One-page summary

5.1 A history of editing technology	The tools changed, but proxies, EDLs, timecode and a feel for frames remain.
5.2 Basic principles of editing	Cut not because it's boring but when the next shot gives better information, and cut mid-action. Lay the sound first.
5.3 Comparing editing software	Premiere and After Effects are the hiring standard. Know both deeply.
5.4 · 5.5 Premiere and After Effects	Premiere handles time horizontally; After Effects handles layers vertically. Split the roles and you halve the time.

5.6 The 12 principles of animation	Fix easing, anticipation, follow-through and exaggeration, in that order, and the beginner look disappears.
5.7 Compositing and keying	A composite floats for three reasons: black levels, atmospheric perspective and grain.
5.8 Color grading	Exposure and white balance first, the look after. Lift · gamma · gain adjust shadows · midtones · highlights.
5.9 Automation tools	Automated output is a draft. A person checks proper nouns, pacing, fingers and lettering.
5.10 · 5.11 Export and expressions	Stick to the right codec for each purpose, and cut keyframes with wiggle · loopOut · time · linear.
5.12 · 5.13 Resolve and animation	One job per node. Choose the method by texture first, budget second. Quality comes from the order of cuts, not the number of transitions.

Questions to consider

Q What makes me decide to cut in my edits?

Is it boredom, or because the next shot gives better information? Write one line on why you dropped each cut, and your criterion emerges.

Q When you feel like adding a transition, what does that spot actually need?

First check whether it really needs an effect, or just a different order of cuts.

Q Self-check

Can you explain each of these: how the roles of Premiere and After Effects differ, when precomposing is needed, alpha vs. luma track mattes, the three reasons a composite floats, and what lift · gamma · gain each adjust?

Q Field tips

Agree on project folder structure and file naming on day one. Save frequently used titles and effects as presets (over two months, that saves a day). Always take revision requests by timecode, and when feedback is "it's just not quite there overall," send it back and ask for specifics.

PART 06

The moment the image leaves the wall,
the viewer becomes the camera.

What you make in this PART

1. One-page spec sheet by medium
2. 16:9 · 9:16 versions of the same material
3. XR exhibition route plan and dwell-time chart

Media specs and immersive content

Where, and how, do people watch video? When the screen is not a rectangle, when the audience walks around instead of sitting, the rules of planning change at the root. This PART tabulates the specs for each medium and also looks at how, and in what posture, audiences watch in each viewing setting.

Photo P-07 A visitor in an immersive projection space · generated image

Using this chapter in class

Tell specs apart by medium and design for vertical screens

Materials Smartphone, safe-area guides by platform, tape measure

10 min	15 min	10 min	10 min	5 min
Intro	Concepts	Plates	Exercise	Wrap-up
Show the result of cropping a horizontal video to vertical	Aspect ratio, safe area, shot size by viewing setting	The media map and the XR continuum	Rebuild the same material in 16:9 and 9:16	Checking official platform guides

> Check point
>
> Captions in the vertical version clear of the UI

PART 06

Introduction

When the screen is not a rectangle, when the audience walks instead of sitting, the rules of planning change at the root. 360-degree video has no frame, an exhibition has no pause button, and an outdoor ad has no sound. Carry conventional film grammar into these conditions unchanged, and you will fail.

Still, the principles carry over. Without a frame you must still guide the eye; with a walking audience you must still design rhythm; without sound you still need dynamics. Only the means change: light and sound draw the eye instead of framing, the visitor's path makes rhythm instead of cuts, and contrast makes dynamics instead of music.

Specs are a search away, but little has been written on how a person in a cinema seat and a person scrolling on the subway take in the same video differently. Knowing that difference is a planner's real edge.

Background 11

A history of screens and the audience's body

Where audiences watch has moved from the theater seat to the living-room sofa, to the screen in the palm, and into devices worn on the head. Each time the screen changed, so did the grammar of the moving image.

In the late 18th century the British painter Robert Barker introduced the "panorama," wrapping the entire wall of a round building in a landscape painting. Viewers stood at the center and took in cities and battlefields spread across 360 degrees. The desire to step into a picture is older than film; today's 360 video and immersive exhibitions are its latest form.

As television entered homes, the film industry widened the screen to stress an experience only theaters could give. The result was Cinerama and CinemaScope in the 1950s, and IMAX, first shown at the 1970 Osaka Expo. With wider screens, directors developed compositions that set a character to one side and let landscape and empty space carry the emotion.

Change also ran the other way. Morton Heilig's 1962 "Sensorama" added vibration, wind, and smell to film, and in 1968 Ivan Sutherland showed an early head-mounted display. Here the audience is no longer looking at a screen but standing inside it. When the medium changes, the audience's body changes; when the body changes, the grammar changes.

The smartphone made the screen small again, and vertical. On a screen held in one hand, the human face becomes the key subject, and captions and interface become part of the image. As Marshall McLuhan said in Understanding Media (1964), "the medium is the message": the same content is received differently depending on the medium that carries it.

The body responds differently to different screen sizes. In a theater the screen fills most of the field of view, so wide landscapes and a slow pace work; a vertical screen in the hand fills only part of it, and the viewer can flick to the next video at any moment. So if you change only the aspect ratio, the rhythm collapses. Cut length, information density, even the size of the figures must be redesigned.

Sound conditions differ too. A theater assumes multichannel sound and low noise; a phone means a small speaker or earphones, and in public people watch muted. Outdoor LED and in-store signage should be as-

sumed to have no sound at all. That is why captions and graphics become the main carriers. Behind every number in a spec table, picture the audience's posture and surroundings.

PART 06 Media specs and immersive content

6.1 Production specs by medium

A project begun without a chosen platform always gets remade. Before starting, lock the specs onto one page.

Medium	Aspect ratio	Recommended resolution	Length	Audio	Key constraint
TV CF	16:9	1920x1080 or higher	15 / 30 s	Yes	Ad review, content rules
Cinema ad	2.39:1 or 1.85:1	DCI 4K	15–60 s	Yes	Bright, high-res
YouTube in-stream	16:9	3840x2160	15–30 s	Yes	Skip after 5 s
YouTube bumper	16:9	3840x2160	6 s	Yes	Non-skippable, single message
YouTube Shorts	9:16	1080x1920	15–60 s	Optional	Loops; captions a must
Instagram Reels	9:16	1080x1920	15–90 s	Optional	Large UI-covered area
Instagram feed	1:1 or 4:5	1080x1350	15–60 s	Muted by default	First frame as thumbnail
TikTok	9:16	1080x1920	9–60 s	Key	Tied to trending sounds
Outdoor LED	Varies by site	Follow the site spec	6–15 s loop	None	Silent; legible from afar
XR exhibition	Space-dependent	Min. 8K advised	60–180 s	Spatial audio	Dwell-time design

NOTE

Short-form length limits and ad formats change often. Write the date you checked into the table.

Specs change

Platform policies and recommended specs change often. The figures here are reference points; always recheck the platform's official creator guide before production.

Exercise 6.1

Task Put the production specs for YouTube, Reels, TikTok, TV, cinema, and outdoor LED in a one-page table.

Tip Check the latest values in each platform's official help and note the date checked.

Assessment Accurate, current information

Model answer Turns the spec sheet into editing presets, ready to use.

PART 06 Media specs and immersive content

6.2 Horizontal and vertical

Not a different medium but a different language. Vertical is not cropped horizontal. Long shots don't survive, and captions become a major part of the frame.

Note Shoot vertical as vertical from the start — people close, information top and bottom

Grammar of horizontal 16:9

- Wide sides, good for relationships and setting
- Long and medium shots carry ample information
- Bottom captions need little eye travel
- Suits two-person dialogue, landscape, architecture
- Default for TV, cinema, long-form YouTube

Grammar of vertical 9:16

- Tall frame suits full-body shots and close-ups
- Long shots turn to mush; rarely used
- Subject on the central vertical axis
- Captions become a major part of the frame
- Default for short-form, stories, live commerce

TIP

The surest way is to shoot the same scene twice, horizontal and vertical. It takes twice as long, but the results are best.

Making a vertical version from horizontal footage

01 Shoot in 4K or higher. A vertical crop from FHD horizontal lacks resolution.

02 Show a 9:16 guide in the viewfinder and keep the main subject centered.

03 Wide left-to-right compositions don't survive in vertical. If a vertical version is planned, change the composition at the shoot.

04 Place captions separately for the horizontal and vertical versions. Carry positions over as is, and the UI will cover them.

05 Shooting the same scene twice, horizontal and vertical, is the surest way.

Exercise 6.2

Task	Shoot and edit the same scene both horizontally and vertically.
Tip	In vertical, keep people close and stack information top and bottom.
Assessment	Recomposing for each format
Model answer	Delivers the same emotion differently in each format.

PART 06 Media specs and immersive content

6.3 Safe areas and platform UI

Not everything in the frame is seen. TV crops the edges, and on short-form the player UI covers the top and bottom. Captions made without knowing the safe area will get covered.

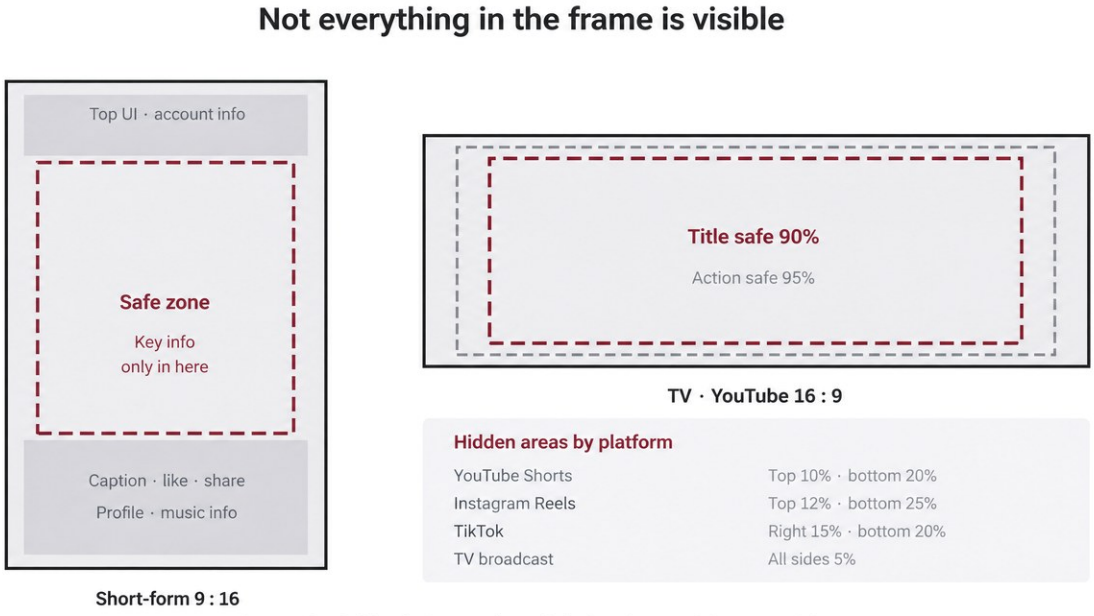

Figure 62 Safe areas on a short-form screen

Medium	Covered area	Safe placement
TV broadcast	About 5% each side	Inside action safe 93%, title safe 90%
YouTube Shorts	Top about 10%, bottom about 20%	Captions centered at the lower 1/3
Instagram Reels	Top about 12%, bottom about 25%	Caption and account name fill the bottom left
TikTok	Right about 15%, bottom about 20%	Left-align, clear of the right icon column
Instagram Stories	Profile at top, actions at bottom	Only the central 70% is safe
Outdoor LED	Varies by site	Follow the safe margin in the site's spec

TIP

Add a phone check after upload to your delivery checklist.

The surest check

Upload the finished cut privately to the actual platform. The real screen is more accurate than any guide in your editing program.

Exercise 6.3

Task	Make a safe-area guide overlaying the Reels · Shorts · TikTok UIs and test caption placement.
Tip	Play it on a real phone and check what gets covered.
Assessment	Safe-area compliance, legibility
Model answer	Builds one template of the safe area shared by all three platforms.

PART 06 Media specs and immersive content

6.4 21:9 CinemaScope in practice

On a wide screen, empty space tells the story. But the narrow vertical space works against captions and short-form reuse.

Note 21:9 — the long horizontal space becomes material for directing

Shooting

4K 16:9 + 2.39:1 guide

- Show a 2.39:1 guide in the viewfinder
- Keep the boom and lights out of the top and bottom crop zones

Editing

3840x1608 sequence

- Exporting at the real reduced resolution beats adding black bars for quality

Captions

Fixed at the bottom 8% line

- Narrow vertical space limits caption position
- Plan the margins ahead

Anamorphic choice

Optical or crop

- Decide first
- Anamorphic adds oval bokeh and horizontal flares

Subjects that suit 21:9

- Cars, travel, spaces, architecture
- Silhouettes against landscape
- Slow tracking moves
- Premium brand campaigns

Subjects to avoid in 21:9

- Tall products (cosmetics, drink bottles)
- Expression-led close-up ads
- Projects meant for short-form reuse
- Ads heavy with caption text

Exercise 6.4

Task	Shoot a scene in 21:9 with both landscape and a person.
Tip	On a wide screen, empty space tells the story. Try placing the person to one side.
Assessment	Use of width, figure placement
Model answer	Places two people at opposite ends of the frame, turning distance into emotion.

Background 12

How immersion is made

Before working with immersive content, we should be clear about what it means for an audience to feel "inside" it. Immersion is a matter of conditions, not image quality.

The history of immersive technology begins with attempts to enlarge the screen. In the 1950s Cinerama filled a curved screen with three projectors to cover even peripheral vision, followed by CinemaScope and 70mm film. Heilig's 1962 Sensorama added vibration, wind, and even smell, and Sutherland's 1968 head-mounted display was so heavy it had to hang from the ceiling, earning the nickname "the Sword of Damocles." The goal was always the same: to pull the audience's vision and senses as far toward the screen as possible.

Researchers split this experience into two concepts. Immersion is the objective condition that equipment and content provide: field of view, response speed to head movement, directionality of sound. Presence is the subjective state the user actually feels, the sense that "I am here." With the same equipment, presence varies greatly with content design. That is why an expensive headset can still deliver a flat experience.

The most common presence-breakers are latency and mismatch. When the image lags a turn of the head, the brain detects a gap between the motion the eyes see and the motion the vestibular system feels. This is the main cause of cybersickness. So VR production keeps frame rates high, avoids camera moves the user did not make, and uses mitigations such as vignetting that masks the edges of the view. Stability comes before image quality.

The premises of directing change too. In 360 video and VR the audience can look anywhere, so the director has only means to guide, not to force. The direction a sound comes from, differences in brightness, a character's gaze and movement, and the layout of the space turn the viewer's head. To keep viewers from missing a key event, plant cues before it happens.

In AR and projection mapping the image sits on real space, so actual light levels, surface materials, and where the audience stands decide the result. A dark wall in an indoor gallery and a building facade at midday are entirely different media. The quality of immersive content is decided not by the final file but by the place where it will be shown.

Further reading — Mel Slater, "A Note on Presence Terminology" · Jaron Lanier, Dawn of the New Everything · Jason Jerald, The VR Book

PART 06 Media specs and immersive content

6.5 Planning 360 video and VR

Where framing disappears, guidance by light and sound moves in. Always give the audience a reason to turn around.

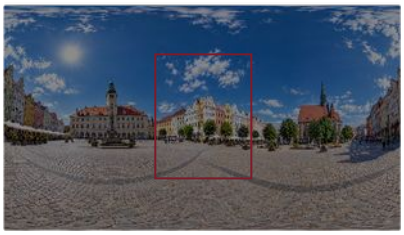
360 video stitches two fisheye images and unrolls them into one map

1 Two fisheye lenses

Two round images, 180° each, front and back

2 Stitched into one — equirectangular 2:1

Like a globe unrolled into a world map, top and bottom stretch



3 The viewer's window

A headset · phone shows only about 90° of this map — red frame

So 360 designs not a "frame" but "ways to call the eye"

Sound — a sound from behind

Light — we look to the bright side

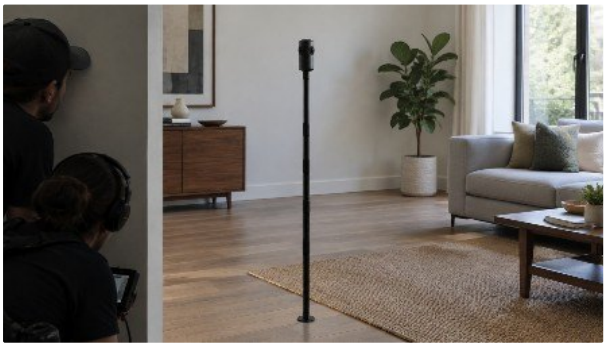
Motion — we follow what moves

Gaze — we look where they look

Lines · paths — we follow the way

Figure 63 The structure of 360 video — two fisheye images are stitched into one map (equirectangular), and the viewer sees only part of it through a window.

Reference photos 6.5A Generated images — directing reference



a

360 camera rig

b

Raw equirectangular frame

c
VR headset viewing

d
A museum visit in MR — virtual restorations and notes overlay the real exhibits

NOTE

For storyboard templates for immersive media (360 · curved · facade · AR/VR/MR/XR), see the PART 2 storyboard Feature.

What disappears

- The idea of framing and shot size
- The free rhythm of cutting
- Camera moves (cause sickness)
- Hiding crew and lights off-screen
- Forcing the eye with composition

What is newly needed

- Guiding the eye with light and sound
- Viewer-based direction (front at 0 degrees)
- Managing the nodal point and stitch lines
- Spatial audio (ambisonic) design
- Experience length (1–3 minutes, not 15 seconds)

Item	Standard video	360 video
Directing unit	Cut	Scene and time
Eye control	Framing	Light and sound cues
Camera position	Free	Eye level, 1.5–1.6m, fixed
Crew	Off-screen	Nowhere to hide; remote operation
Editing	Frequent cuts	Long takes, fade transitions
Resolution	4K is enough	Min. 8K advised (view is a slice)

Shooting and comfort design

Term

Nodal point — the optical center of the lens. Rotate around this axis to keep stitching errors to a minimum.

Stitching

Lines and minimum distance

- A stitch line is where lens edges overlap — keep key subjects off it
- Stitching breaks within 1m of the camera. The floor for subject distance

Anti-sickness

No acceleration · fixed reference · narrow view

- Sight and inner-ear mismatch causes sickness. Constant-speed moves only
- A fixed reference in frame, like a cockpit or railing, greatly reduces sickness
- Vignetting narrows peripheral vision during moves

Eye-guiding cue	How	Strength
Spatial audio	Turns heads toward the sound	Very strong
Light, brightness	Darken the surroundings, light only the target	Strong
Motion	One thing moves in a still space	Strong
Gaze	A performer looks in a set direction	Medium
Color, contrast	Complementary or saturated colors	Medium

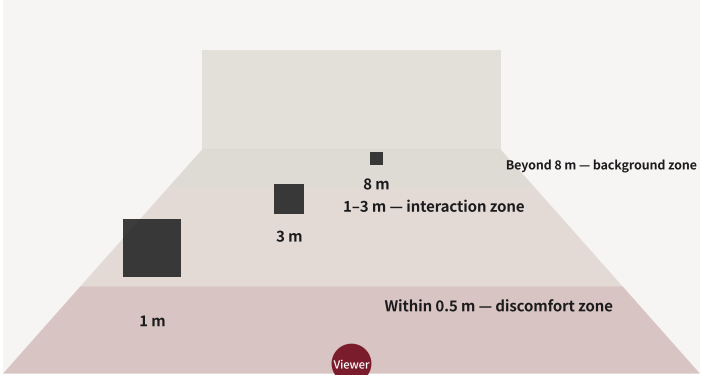
> If the experience ends and no one has looked behind them, the plan has failed.
>
> 6.5 The test of a 360 plan

G-21 360 video and VR — a space where the viewer becomes the camera (GPT-generated image — for concept only)

Design VR space by distance

VR has distance instead of a frame. What you place where, around the spot the viewer stands, takes the place of shot size. Too close and the eyes cross uncomfortably; too far and it becomes background.

Design VR space by distance



Three boxes of the same size

- 1 m — large and solid, almost touchable
- 3 m — moderate, the most comfortable distance
- 8 m — small and flat, like background

Five ways to reduce sickness

- Don't accelerate — constant speed or teleport
- Don't tilt the horizon
- Camera at viewer height (1.6 m)
- Keep what matters within ±60° of front
- 60 fps or more, latency 20 ms or less

Figure 64 Distance design in VR — the same box at 1 m, 3 m, and 8 m from the viewer differs in size and depth. Put interaction at 1–3 m and background beyond 8 m.

Reference photos 6.5B Media where the audience stands — VR · 360 · fulldome

a

The viewer's body is the camera — arm's reach is the first unit of design

b

Guide marks on the floor take the place of framing

c

The crew has nowhere to hide, so operate remotely and erase the base in post

d

Immersion without headsets — many people look up at the same space

Exercise 6.5

Task	Plan a 30-second scene that guides the viewer's eye, using a 360 camera or a smartphone panorama.
Tip	Use sound, light, and motion to show where to look.
Assessment	Eye-guiding cues, anti-sickness
Model answer	Designs a flow where the story holds wherever the viewer looks.

PART 06 Media specs and immersive content

6.6 AR ads and WebAR

First ask whether this experience has a reason to be AR. If video is enough, AR is a waste of money.

Type	How it works	Tool family	Ad use
Face filter	Detects a face, attaches graphics	Social platform creator tools	Product try-ons, brand challenges
Marker AR	Recognizes a set image, then plays	AR authoring tools	Packaging, poster tie-ins
Plane-detection AR	Detects floors and walls, then places	Mobile AR frameworks	Furniture and appliance placement previews
Location-based AR	Activates at GPS coordinates	Location-based platforms	Store visits, local campaigns
WebAR	Runs in the browser, no app install	WebAR services	Instant QR experiences

TIP

The first screen, reached without installing an app, matters most.

Four principles for planning AR ads

01 First ask why it must be AR. If video is enough, AR is a waste of money.

02 Keep the experience under 30 seconds. Real average time spent in mobile AR is very short.

03 Always design a moment worth sharing. Captures and shares are the real performance metrics of AR ads.

04 Test on low-end devices. An experience that only works on the latest devices fails.

AR glasses, captions before your eyes

AR that once meant holding up a smartphone is moving down onto glasses. As of 2025, smart glasses on the market fall into three broad types; product names will change, but the types will hold for a while.

Camera · AI voice

Ray-Ban Meta family

- No display; only a camera, speakers, and voice AI
- 1st-person photo · video, describes what's in front of you
- Speaks live translation into your ear
- The lightest, best-selling type

Display

Xreal family · Meta Ray-Ban Display and others

- Small display in the lens — captions · navigation · translation
- Xreal models show a connected device's screen as a big virtual screen in front of you
- Meta Ray-Ban Display: a small color display in one lens, wristband gesture control
- Narrow field of view; can't show long text

Spatial computing headset

Apple Vision Pro · Meta Quest family

- Passthrough cameras float windows and 3D objects over reality
- Hand and eye tracking controls; plays spatial video
- Weight and price make it no "everyday wear" device
- Go-to device for indoor experiences · exhibitions · education

TIP

Think of captions for glasses as one line at a time, a few words per line. Deliver to the ear first, not the eye, and use text as support.

Three things change for makers. First, text appears small at the edge of vision, not in the middle of a screen. Unless it is short, large, and high-contrast, it won't be read.

Second, voice comes first. Glasses are a hands-free medium, so a flow of asking and answering replaces touch. Third, 1st-person video becomes the default format. Every head movement is captured, and aspect ratios vary by device, so you can't assume horizontal 16:9.

"Beyond the lens," as film first drew it

The Terminator's red vision HUD identified objects in view and overlaid data; Minority Report showed a gesture UI that drags screens around in midair; and Iron Man's helmet HUD planted the idea of a 1st-person interface where information floats with your gaze.
The "short text at the edge of vision," "gesture control," and "voice that describes what you see" of today's AR glasses are all grammar that film drew first. Audiences have seen those screens dozens of times, so AR content reads without explanation.

Reference photos 6.6A A layer over reality — from AR in hand to AR in view

a
Plane-detection AR — find the floor, then place the object

b
Display glasses — a one-line caption appears at the edge of vision

c
The 1st-person HUD in film — imagination that became today's AR grammar

Exercise
6.6

Task	Pick a product and sketch a WebAR experience as a 3-step screen flow.
Tip	The first screen, reached without installing an app, matters most.
Assessment	Simple user flow, motivation to share
Model answer	Makes the result flow naturally into social sharing.

PART 06 Media specs and immersive content

6.7 Planning MR and XR exhibitions

An exhibition plan must calculate hourly throughput. A plan without this number will cause queue problems on site.

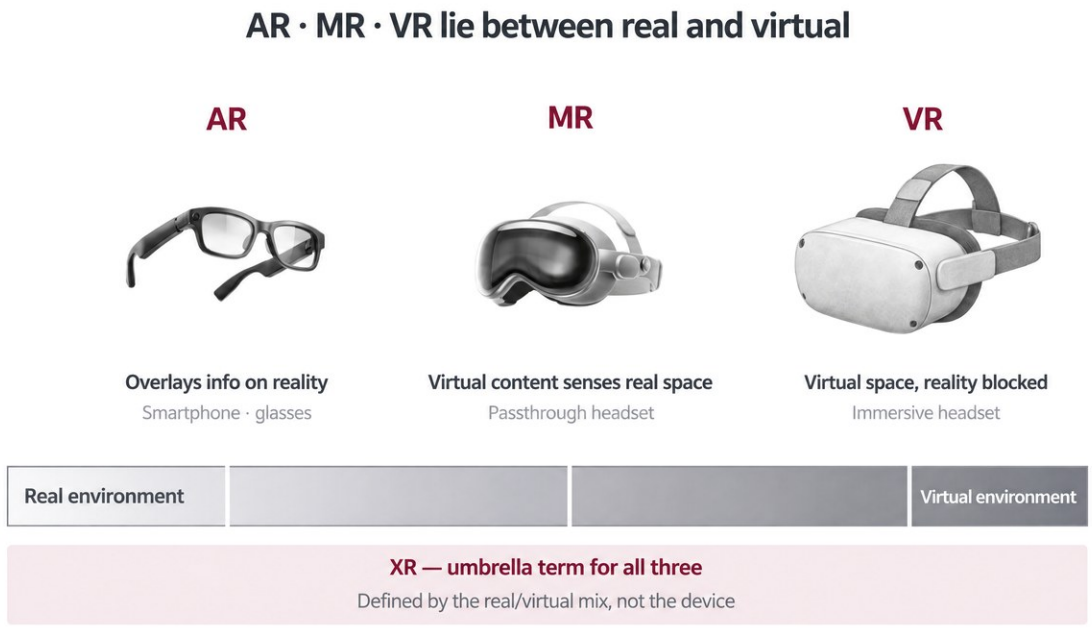


Figure 65 AR, MR, and VR on the continuum between real and virtual

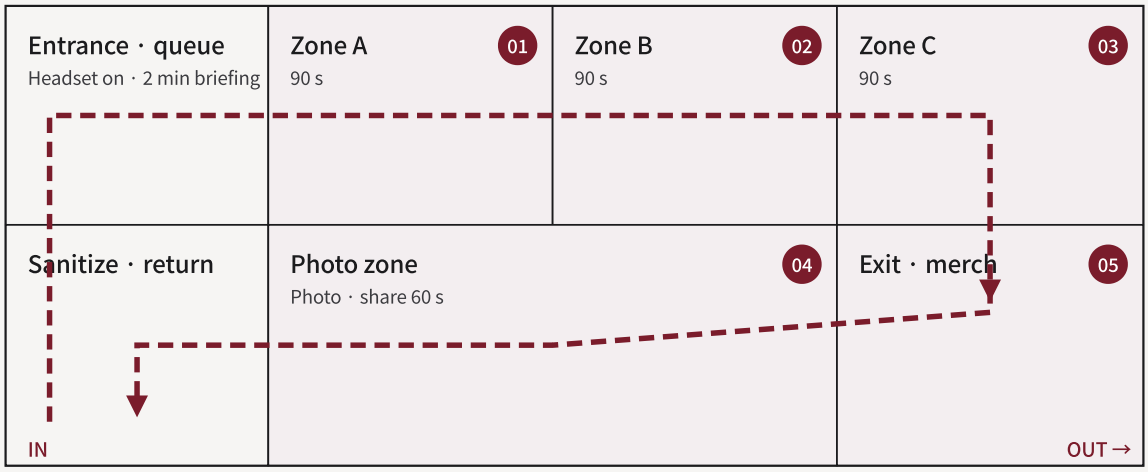
Design the visitor route as one line from entrance to exit



From entrance to exit in **one line**. If the route doubles back, people in headsets bump into people without them. 90 s experience × 3 + 60 s photo + queue = about 8 min for 1 person, about 40 people per hour.

Figure 66 XR exhibition floor plan — the red dotted line is the visitor route; numbers show the order.

8 planning stages

01	02	03	04
Theme	**Site survey**	**Scenario**	**Route**
One-sentence take-away after the visit	Measured plans, ceiling height, power, lux	Dwell-time chart by section	One-way or free-roaming plan

05
Technology
Equipment specs, backup gear

06
Content
Content list by space

07
Installation
On-site calibration log

08
Operations
Staff manual, failure response

Note

Often missed — choosing the tech before the message, ceiling height and power capacity, no plan for wait times.

What gets missed at each stage

Planning

Theme · space · scenario

- Choosing the tech before the message
- Ceiling height and power capacity
- No plan for wait times

Execution

Route · tech · install · operation

- Bottlenecks and backflow
- Maintenance and spare parts
- Underestimated install time
- No restart procedure

90 s
Length of 1 session

4 people
Capacity at once

160 people/hr
Theoretical max

70 %
Realistic, with changeover · briefing time

Dwell-time math

Combine the length of 1 session with simultaneous capacity to get hourly throughput. A 90-second experience for 4 people at once tops out at 160 people per hour in theory; in real operation, add changeover and briefing time and plan on about 70% of that figure.

MR in museums

Note Leave the original as is; fill only what's missing with light

Museums are where MR is most convincing, because the constraint that originals cannot be touched or moved becomes MR's very strength.

The National Museum of Korea runs a digital immersive gallery within its permanent exhibition, showing content such as a VR Goguryeo mural tomb, large panoramic films, and a digital Gwanggaeto Stele, and major national museums abroad also run artifact-restoration AR and MR tours. Their setups mostly come down to three elements.

- Restoration holograms — the missing shards of broken pottery, or a worn Buddha statue's original colors, laid over the real object. Keep some transparency so the line between original and restoration shows.
- Docent avatars — read the visitor's gaze and position to explain the artifact they are looking at. Keep the talk under 30 seconds per artifact; the visitor chooses whether to hear more.
- Hand-tracking control — pick up, turn, and enlarge artifacts by hand, without controllers. Place objects within arm's reach (about 0.5–0.7 m) and have them return to place when handling ends.

Note

In museum MR, hygiene and turnover are half the plan. Put headset sanitizing time between users and briefing time into the dwell-time chart.

Note

XR stage — with camera tracking and a real-time engine, the LED background follows the camera's moves. Exhibition XR zones and virtual production for film use the same technology

Exercise 6.7

Task	Make a route plan and a content list by space for a fictional XR exhibition.
Tip	Set a visitor dwell time for each space.
Assessment	Visitor flow, fit between space and content
Model answer	Contrasts the entry and exit experiences to build a memorable structure.

PART 06 Media specs and immersive content

6.8 Projection mapping

Build the content on an unfolded template of the target. It works best when the edges of real structures, such as windows and columns, become the structure of the content.

G-22 Projection mapping — the building surface becomes the screen (GPT-generated image — for concept only)

Note Window and column edges become the content's panels — why you build on the template

Principle

Measure → match → correct → calibrate

- Measure the target's 3D form and rebuild it as a virtual model
- Match the projector position to the virtual camera
- Correct distortion per surface, render video
- Fine-tune with on-site calibration after installation

Planning factors

Surface · ambient light · distance · blending

- Dark, rough surfaces lose a lot of brightness
- Night or blackout conditions required
- Work out throw distance and brightness (ANSI lumens)
- With multiple projectors, leave blend zones

Term

ANSI lumens — the unit of projector brightness. The amount needed grows with projection area and ambient light.

Factor	Criterion	Typical figures
Brightness	Scales with area and ambient light	20000 ANSI or more for outdoor buildings
Throw distance	Set by the lens throw ratio	Short-throw lens saves space
Resolution	Based on closest viewing distance	4K or more for close viewing
Content format	Target's unfolded template	Nothing like standard 16:9
Mounting	Resist vibration and heat swings	Rigging and cooling plans required

Exercise 6.8

Task	Project a simple mapping video onto a box or wall.
Tip	Divide the surfaces with masks first, then give each surface its own motion.
Assessment	Surface fit, sense of depth
Model answer	Uses the building's structure to create the illusion of it collapsing or opening.

PART 06 Media specs and immersive content

6.9 Outdoor advertising and anamorphic illusion

The viewpoint is the design condition. Fix the virtual camera where most viewers stand, and make a scene people will film and share from that spot.

An image split and distorted across two faces merges into one from just one point

From the reference viewpoint — the box pops out
The images on two faces merge into one from one point

From the side — two warped images
Leave the reference viewpoint and the illusion breaks

> Images drawn **deliberately distorted** on two faces merge into one only from a single point. So the first design question is "where does the viewer stand?" That spot is the photo spot (where online spread begins). Measure sidewalk width · cross-walks · the opposite sidewalk first.

Figure 67 How anamorphic illusion works — a box from the reference viewpoint, two warped images from the side.

Reference photos 6.9A Generated images — directing reference

a
Anamorphic corner LED

b
LED wall virtual production

c
Transparent LED shop window

Anamorphic principle

Depth from one viewpoint only

- Distorted video on an angled LED screen
- Viewpoint is the design condition

Reference viewpoint

Fix the virtual camera

- Where most viewers stand
- Step off that spot and the illusion collapses

Content conditions

Subjects with soft edges

- Structures boxed in, objects bursting out
- Soft-edged subjects such as water and clouds

The real payoff

An angle that's good to film

- Real reach comes from people who film and post online, more than from viewers on site

TIP

Outdoor ads are silent by default. A plan that relies on sound has already failed at the choice of medium.

DOOH medium	Traits	Content design principle
Large LED billboard	Mass exposure at a distance	One message read in 3 seconds, no audio
Transit media	Repeated close exposure	Short repeating loop, caption-led
In-store signage	Point of purchase	Price- and offer-led information
Elevator media	Brief captive exposure	6–10 s loop, clear without sound
Special anamorphic LED	Buzz and spread	Design a scene people film and share

G-23 Anamorphic LED — the illusion of depth from a corner screen (GPT-generated image — for concept only)

How anamorphic content is made

01
Site survey · viewpoint

Measure the LED faces and their fold angle, and fix the 'sweet spot' where most viewers stand

02
3D modeling + sweet-spot camera

Build the LED faces to measured size in a 3D tool such as Unreal Engine · Cinema 4D · Blender, and fix a virtual camera at the sweet spot

03
Content · render

Project what the virtual camera sees onto the unfolded LED template and output it. Objects that cross the screen edges strengthen the illusion

04
On-site correction

Play it on the real LED, film from the sweet spot, and fix seam misalignment and brightness · color

Note

Vertical anamorphic — a waterfall pouring down a building corner. The illusion holds only at the sweet spot, which is also the photo spot and the starting point of online spread

Media facades in Korea

Gwanghwamun · Cheonggyecheon

Seoul Light Gwanghwamun · Seoul Lantern Festival

- Held around Gwanghwamun Square and Cheonggyecheon as part of the winter Seoul Winter Festa
- Large media facade shows in the square, light sculptures, media art by open-call artists
- Heritage sites and the square are the stage, so the content follows the lines of the architecture

COEX · DDP

K-POP Square 'Wave' · Seoul Light DDP

- 'Wave', the anamorphic wave on COEX K-POP Square's large corner LED, is Korea's signature anamorphic work
- Seoul Light DDP uses the curved DDP exterior as a screen, with a new artist each year
- At both, reach comes from 'viewers who film and post'

National Assembly

Facade lighting and the 'Mazinger Z meme'

- The main building's exterior is lit at night
- The old joke that "a robot comes out when the dome opens" shows how the perceived shape of a building can itself become content
- When using a building as a medium, first research the image people already have of it

Reference photos 6.9B When architecture becomes a screen

a

Roof-tile lines and column spacing become the content's grid

b

How people read a building's shape can itself become content

Exercise 6.9

Task	Draw a storyboard for an anamorphic illusion on a corner LED screen.
Tip	The illusion holds only if you fix the viewing position first.
Assessment	Viewpoint design, clarity of the illusion
Model answer	COEX SMTOWN 'Wave' (2020). Marks the viewing position on a map and shows a composite image from that viewpoint.

PART 06 Media specs and immersive content

6.10 LED signage and transparent LED

Using terms like pixel pitch and nits with vendors makes quotes more accurate. With transparent LED, remember first that black turns transparent.

Term	Meaning	Criterion	Effect on content
Pixel pitch	Spacing between LED dots	Smaller number, finer image	P2.5 or less for close-range media
Min. viewing distance	Distance at which the image looks smooth	Roughly the pitch value in meters	P4: about 4m or more
Luminance (nits)	Screen brightness	Indoor 500–1500, outdoor 5000 or more	High-contrast design outdoors
Transmittance	How much shows through a transparent LED	About 60–80%	Background shows through; dark colors suffer
Refresh rate	Screen refreshes per second	3840Hz or more if it will be filmed	Too low and it stripes on camera
Cabinet size	Size of one panel unit	Basis for total resolution	Sets content resolution

Term

Pixel pitch — the spacing between LED dots (mm). At P4, the minimum viewing distance is about 4m.

Designing for transparent LED

- The background shows through, so black turns transparent
- Bright, saturated graphics work best
- Thin lines and small text disappear
- Check against both day and night backgrounds

Caution: LED on camera

- Low refresh rate causes rolling bands on screen
- Sync the camera shutter with the LED refresh
- People in front of LED: color temperature clash
- A test shoot beforehand is a must

Distance sets the text size

Distance sets the text size

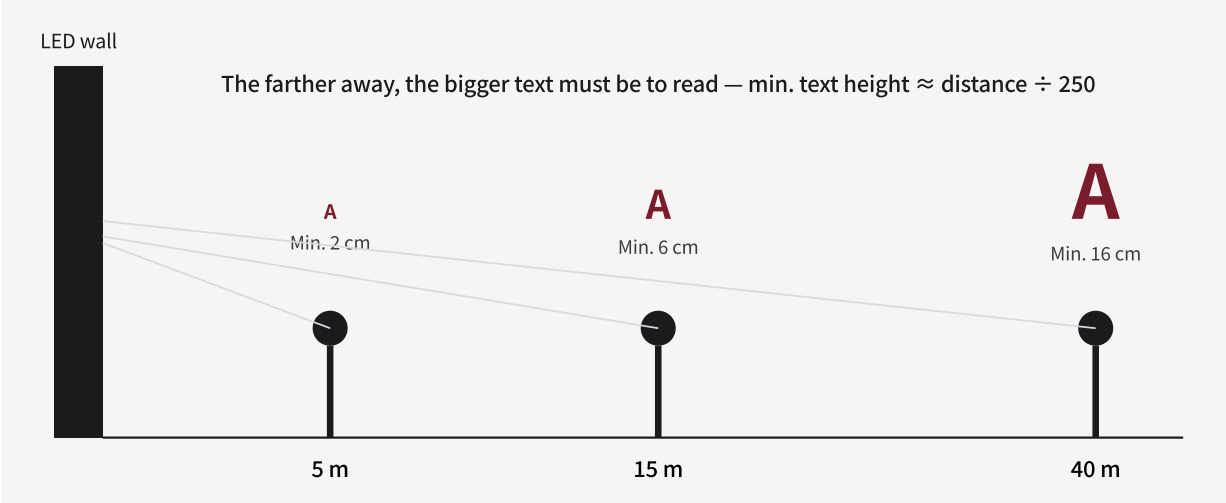


Figure 68 Viewing distance and text size — 2 cm at 5 m, 6 cm at 15 m, 16 cm at 40 m. Conversely, the closer a screen is viewed, the finer its pixel pitch must be (minimum viewing distance m ≈ pitch mm).

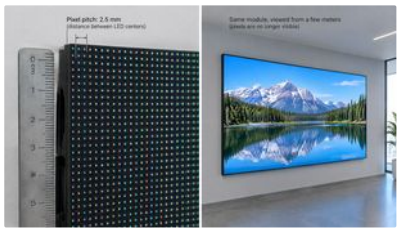
Reference photos 6.10A Three faces of LED media

a Black becomes transparent — show only bright objects

b A medium seen in passing — short loops, big text



c The pitch number is your scale for minimum viewing distance

Exercise
6.10

Task	Make a 10-second loop for a transparent LED. Assume black reads as transparent.
Tip	Leave the background empty black and move only bright objects.
Assessment	Grasp of the medium, loop continuity
Model answer	Accounts for how the real space behind the glass overlaps the video.

PART 06 Media specs and immersive content

6.11 Viewing environments and audiences

Gaze, distance, movement. The same video works entirely differently depending on where it is seen. Whether viewers sit or stand, are alone or in groups, pass by or linger changes the terms of direction.

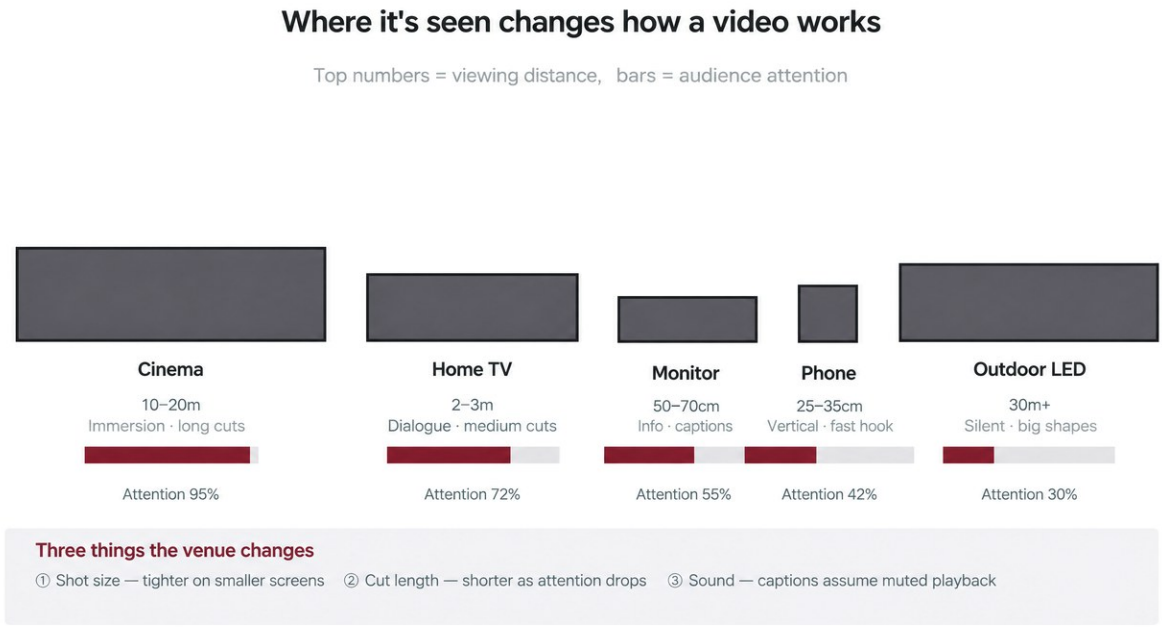


Figure 69 Screen size and attention by viewing environment

Screening formats differ — screen · sound · body

IMAX · premium large format

A giant 1.43:1 or 1.90:1 screen, steep seating — the screen fills your vision. Films shot on IMAX film cameras, like The Odyssey (2026), design scenes specifically for this ratio

4D motion theater

Moving seats · wind · water · scent. A separate "effects cue sheet" is written apart from the picture — deciding the stimulus for each cut is a 2nd edit

Format	Aspect ratio	Sound	Add-ons	Production notes
Standard 2D	1.85 · 2.39:1	Standard 5.1–7.1 sound	None	Baseline — source for all versions
3D	Same	Same	Polarized glasses	Design the parallax: near objects clash with subtitles, fast pans cause dizziness. Brightness −30%
IMAX	1.43 · 1.90:1 (more room top and bottom)	12-channel · boosted bass	None	Needs extra top and bottom image shot separately (IMAX camera) or a master opened up vertically
4D	Per theater	Same + effects track	Seats · wind · water · scent · lighting	Needs "breathing cuts" to place effect cues. Nonstop effects are tiring

Figure 70 2D · 3D · IMAX · 4D — even the same film differs by version in aspect ratio · sound · stimulus. Production decides "which version to shoot for" before the shoot.

Environment	Posture	Viewing distance	Field of view	Attention	Design principle
Cinema	Fixed seats, dark	1.5–3 times screen height	Very wide	Very high	Long shots work, slow pacing allowed
Living-room TV	Seated, lit room	2–3 times screen diagonal	Medium	Low	Close-up driven, clear dialogue
PC monitor	Seated, close	50–70cm	Narrow	Medium	Dense information is fine
Smartphone	Handheld, on the move	25–35cm	Very narrow	Very low	Big captions, short cuts, vertical
Large outdoor	Walking past	10–50m	Very wide	Very low	Single message, high contrast
Exhibition	Standing, moving	1–5m	Wide	High	Designed dwell time, spatial audio
In-store signage	Standing, briefly	1–3m	Medium	Low	Price and offer up front

Cinema

Guiding the gaze

- On a big screen even corner details read, but the screen looks skewed from some seats, so avoid the extreme edges
- The dark room lets low-key looks work best
- Surround sound allows directional audio
- The audience can't leave, so there is time to unfold a story

Mobile scroll

What makes it different

- One finger and they're gone — the starting point of every short-form rule
- Little peripheral stimulus, so motion and captions take over that role
- Design it to work fully on mute
- Assume looping; join the end to the start
- Vertical motion registers more strongly than horizontal

Exhibition flow design

TIP

Visitors' phones are the best distribution network. Design photo-zone lighting and backdrops for shooting and sharing.

01 Within 3 seconds of entering, visitors should grasp what the place is for.

02 Put a waiting area and a preview before each experience zone. Waiting time is content too.

03 Choose clearly between a one-way route and free roaming. Mix them and you get bottlenecks and backflow.

04 Place the most striking scene just before the exit to shape the last memory.

05 Design photo-zone lighting and backdrops for shooting and sharing.

06 Build rest areas and restrooms into the route. Past 20 minutes of experience, they are essential.

Order of work when one piece spans several media

Build first for the most constrained medium. If you must do both short-form and outdoor, lock a single message for outdoor, then expand into short-form. Do it the other way and the information overflows until nothing reads outdoors.

Exercise 6.11

Task	Pick a spot on campus, survey its viewing conditions (distance, brightness, foot traffic, sound) and propose a suitable video format.
Tip	Time how long people stay in that spot.
Assessment	Specific observation, fitting proposal
Model answer	Sets video length and even text size to match dwell time.

PART 06 Media specs and immersive content

6.12 Types of immersive content projects

Real projects are one of the types below, or a mix. Fix the type first and the outline of the technology and budget takes shape.

Type	Elements	Core technology	Metrics
Brand pop-up exhibition	3–5 experience zones, photo zone, merch	Projection, sensors, LED	Visitors, SNS posts
Immersive media art	Wall-to-wall video and sound in a large space	Multi-surface projection, spatial audio	Dwell time, return visits
Virtual showroom	View and place products in 3D	WebGL, AR	Completion rate, conversion
Training simulation	Recreating dangerous or costly situations	VR HMD, interaction	Learning outcomes
Public info exhibit	Local history, science, safety education	Touch interaction, video	Visitor satisfaction
Outdoor anamorphic	Building-corner LED illusion	3D render, viewpoint calibration	Online spread
Live XR performance	Real-time graphics with live show	Real-time engine, tracking	Attendance, stream views

TIP

Analyze cases by audience experience, not technology.

What every proposal must include

- A one-sentence reaction after the visit. Write first what visitors feel as they leave, not a list of technologies.
- Measured drawings and ceiling height, power capacity, ambient light.
- Dwell-time schedule by zone and hourly throughput calculation.
- Equipment specs, spare units, maintenance plan.
- Staff manual and failure-response procedures. Always document how to restart.
- Safety plan. Include floor guide lights in dark spaces and emergency routes.

Exercise
6.12

Task	Analyze 3 immersive content cases by type and propose one project suited to your area.
Tip	Analyze cases by audience experience, not technology.
Assessment	Consistent analytical frame, feasible plan
Model answer	Realistically estimates even the budget and operating staff.

PART 06 Media specs and immersive content

6.13 New displays and spatial media

Since the mid-2020s, the surfaces that carry video have multiplied fast. Planners must know their minimum specs to hold a conversation with vendors.

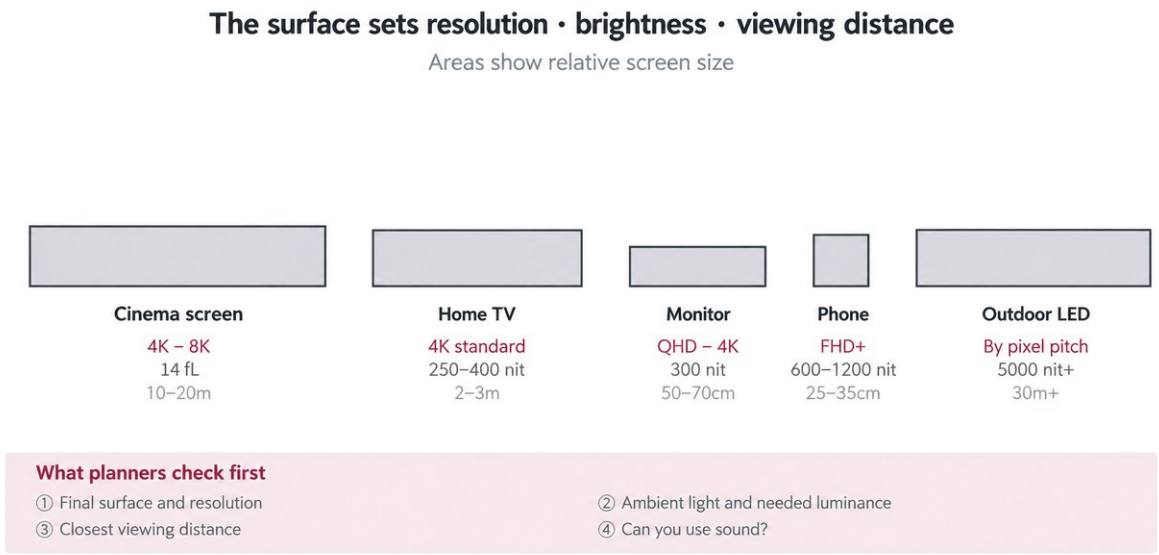

Figure 71 A map of screen specs by medium

Large TVs and the living room

- 4K is now standard, and 8K panels have reached budget models. But 8K content is scarce, so upscaled playback is the norm.
- As HDR panels spread, the range of brightness has widened.
- As screens grow, viewing distance is shrinking to 1.5–2 times the diagonal. That is why broadcast grammar, once close-up driven, is widening again.

NOTE

If you make an HDR master, always make an SDR version with it.

— Smart TV apps have brought YouTube and streaming into the living room. Also consider vertical short-form playing on a large horizontal screen.

Giant LEDs and media facades

Light cast onto a surface vs. a surface that glows itself

Projection mapping — light cast onto it

Visible only in the dark · the building's form is the canvas · quick to install, suits one-off events · throw distance and projector count are key

LED signage · media facade — the surface itself glows

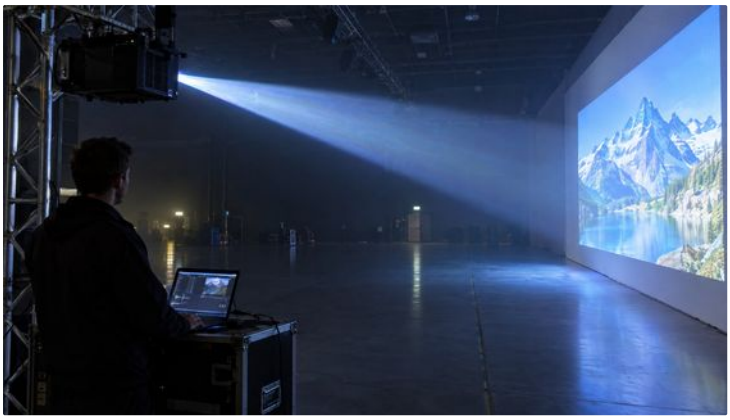
Visible by day · runs all the time · pixel pitch and viewing distance are key · costly to install, but content is easy to swap

> Projection borrows a **surface**; LED builds a **surface**. For a one-night event, projection; if it must be on every day, LED.

Figure 72 Projection mapping and LED signage — both are "video on a building," but the light comes from different sources.

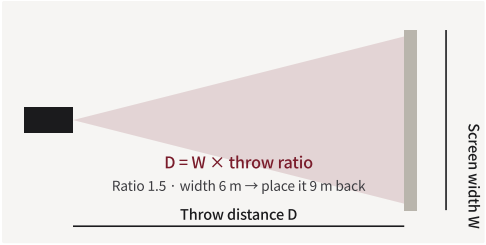
Category	Projection mapping	LED signage
Setup	Secure projector position and throw distance	Panels mounted on a structure
Setting	Night · blackout required	Works day or night
Brightness	Rated in ANSI lumens	Rated in nits
Surface	Brighter and smoother is better	Surface emits light itself
Content	Made to the building's template	Made to panel resolution
Cost	Low upfront, costly to run	High upfront, stable to run
Removal	Easy	Needs structural work

Throw distance = screen width × throw ratio



A projector makes its screen with distance

Farther means bigger and dimmer — the brightness (lumens) needed scales with area



The working formula

Throw Ratio = distance ÷ width. Short throw 0.3–0.8, standard 1.2–2.0, long throw 2.0 or more · Brightness target: dark interior 1,000–2,000 lm/m², bright lobby 3,000 lm/m²

Figure 73 Projector throw distance and screen size — fix two of distance · screen width · throw ratio and the third follows. It's the first number to measure before installing.

01	02	03
Area	**Resolution**	**Brightness**
Measured size of the projection surface	Resolution needed at the closest viewing distance	Measure ambient light and work out the brightness needed

How many projectors you need follows naturally once these three numbers are in. Unit count and lens specs are results, not starting points.

Headsets and spatial video

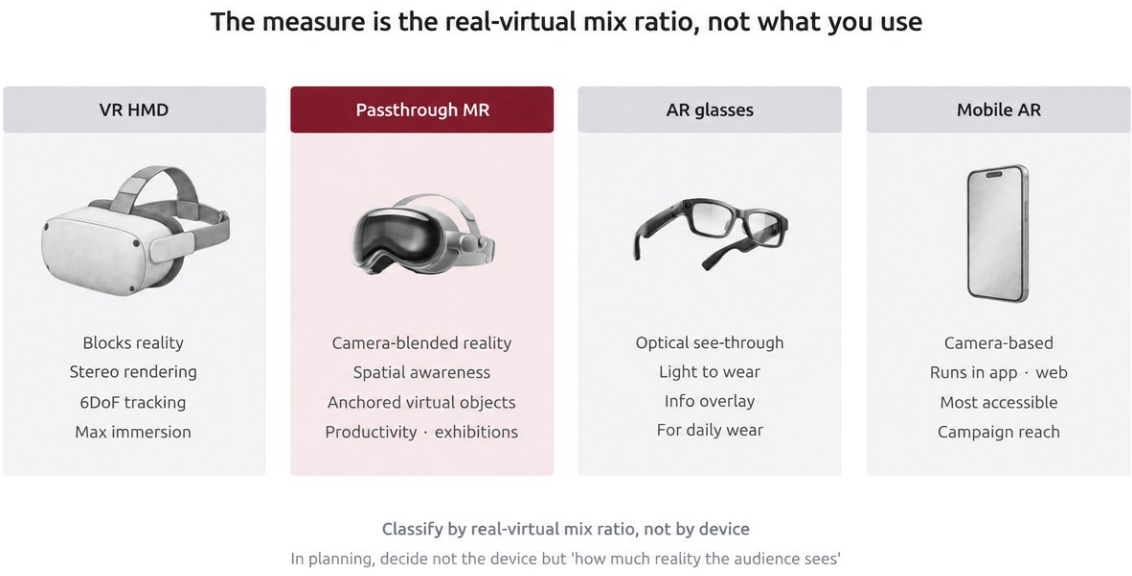


Figure 74 4 XR devices compared

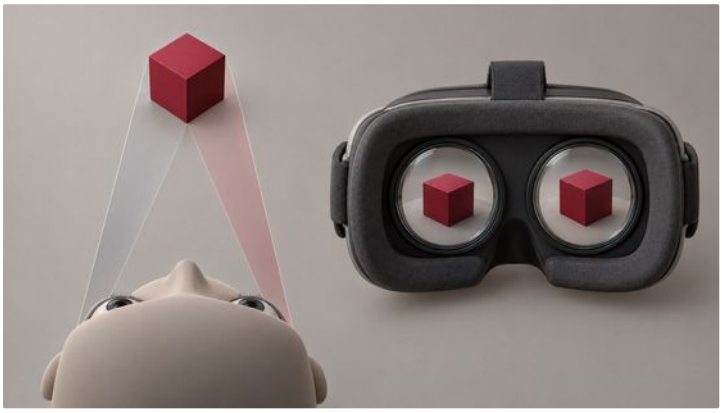
Apple brought spatial video to the public with Vision Pro, Meta spread passthrough mixed reality with its Quest line, and Google is betting on an Android-based XR platform and lightweight AR glasses. They share one thing: the screen breaks out of the rectangular frame and expands to the user's entire field of view.

Spatial video records the parallax of two eyes as is to create depth



Binocular parallax becomes depth

- Our two eyes are about 65 mm apart — each sees the same object at a slightly different angle
- The brain reads that difference (parallax) as depth
- Spatial video records both views with two lenses, and the headset shows each eye its own image
- More parallax looks closer; too much hurts the eyes

Figure 75 How spatial video records in stereo — it captures the two views the eyes see and returns them to the eyes.

Spatial video

Stereo capture and long takes

- Two lenses record at once, spaced about like human eyes. A wider baseline adds depth but strains the eyes up close
- Frequent cuts are uncomfortable, as the brain needs time to rebuild depth. Long takes are the norm
- Place captions as objects with a depth value. If the depth is off, focus wavers

AR glasses · passthrough

Black and brand colors

- Optical see-through can't show black. Dark tones simply turn transparent
- Passthrough replays reality shot by cameras, so color and exposure follow the device. Don't count on accurate brand colors

Reference photos 6.13A Generated images — directing reference

a Media facade

b Immersive exhibition space

c Wearing AR glasses

Note A space where the screen's four edges vanish — even visitors' shadows become part of the content

What practitioners should prepare now

Even with no headset project in sight, shooting current work in 8K or higher and designing the sound in spatial audio makes later expansion far easier. Resolution and sound can't be made after the fact.

Immersive spaces — the screen became a building

Spherical LED building (Las Vegas Sphere, 2023)

Outside, a spherical LED about 110 m across; inside, a 16K curved screen and haptic seats. Content is designed as the "building's skin," not a "screen"

Dome video (planetarium · dome theater)

A hemisphere watched lying back. With no horizon, motion sickness comes easily, so move the camera slowly and keep subjects within 60° of the zenith

Multi-floor experiential museum

Across 4 floors, walls · floors · ceilings are all screens. Sensors read visitors' positions and the video responds — "the work is complete only when visitors walk in"

360 surround media space

Four walls and the floor form one canvas (like Korea's ARTE MUSEUM). Even sound and scent are designed. Each scene loops for 3–5 minutes; thousands pass through daily

Museum VR experience

Walk through restored palaces · ruins. QR by an artifact → phone AR, experience zone → headset. It offers "being there," not commentary

XR stage

Shooting in front of an LED wall — the background shifts with camera movement. Becoming the standard set for broadcast · ads · music videos

Ceiling media — a whale passing overhead

Ceiling LEDs in airports · public halls. Viewers stand and look up, so use a one-scene loop that reads in 10 seconds, with sound from floor speakers

Theme park facade mapping

A whole castle-shaped building as the screen — a 10-minute show cued to fireworks · music · lighting. Same time every day, changed each season

Hologram show (floating image)

An image reflected on a 45° transparent film looks solid on stage — late singers revived · virtual idols. Bright light makes it vanish, so blackout design is everything

Surgical robot console and VR simulator

With da Vinci-type robots, the surgeon operates while looking into the console's stereo viewer. Residents practice on the same view recreated in VR — video tech turned medical training

Where VR is used — four fields beyond games, and games

Medicine
Surgical simulation · anatomy education · pain relief (VR during burn dressing changes) · exposure therapy for phobias

Military · safety training
Shooting · tactics · fire evacuation · heavy machinery — repeat drills for dangerous, costly situations

Elder care · rehab
Reminiscence therapy (360 hometown scenery) · balance rehab games · travel for seniors who can't go out

Disability · accessibility
Hiking · travel · concerts for people with limited mobility, autism-spectrum social skills training, visual impairment simulation for education

Rhythm games (Beat Saber-type)
Slash blocks to the music — VR's "killer app." A full-body workout and a lesson in visual rhythm

Space · flight (Elite Dangerous · No Man's Sky VR-type)
Scale and stillness — a textbook in immersing players in vast space without motion sickness

Sports (VR golf-type)
Swing path and course as they are — immersion runs deepest when real motion transfers 1:1

3D printing — props · sets · characters
Model data becomes physical. Ad props · miniature sets · even replacement faces for stop-motion characters. A round trip between digital and physical

Education platforms — VR learning spaces such as ENGAGE open lecture halls · labs · historic sites to many users at once. For video majors, they answer the question of "where to post 360 content."

Figure 76 Immersive spaces and uses of VR — the screen becomes a building, and VR moves beyond games into medicine · training · elder care · accessibility. Photos are generated images evoking the mood, not specific facilities.

Exercise 6.13

Task	Pick one new display technology and write a video idea possible only on that medium.
Tip	Avoid ideas that just port existing video over.
Assessment	Use of the medium's traits
Model answer	Turns technical limits into creative constraints.

PART 06 Media specs and immersive content

6.14 Dimensions of form

Point · line · plane · volume · time. Immersive content goes beyond the screen and treats the whole space as material for form. From point to time, motion adds one dimension at a time.

Reference photos 6.14A · 6.14B Generated images — directing reference

a Point — a single light in the dark

b Line — a trail drawn with light

c Plane — a screen catching light

d Volume — a form made of light

e Time — the trace of motion

f Moving through space — scenes shift as you walk

Counting dimensions

The point starts at 0D, so volume is 3D and adding time makes 4D. Remember that point, line, plane, volume, time each add one motion, in that order, and you won't get confused.

In geometry, a point has position but no size and is 0D; a line, the path of a moving point, is 1D; a plane, the path of a moving line, is 2D; and a volume, the path of a moving plane, is 3D. Add time and it becomes 4D, and when the viewer walks inside, movement through place is added.

Motion adds one dimension at a time

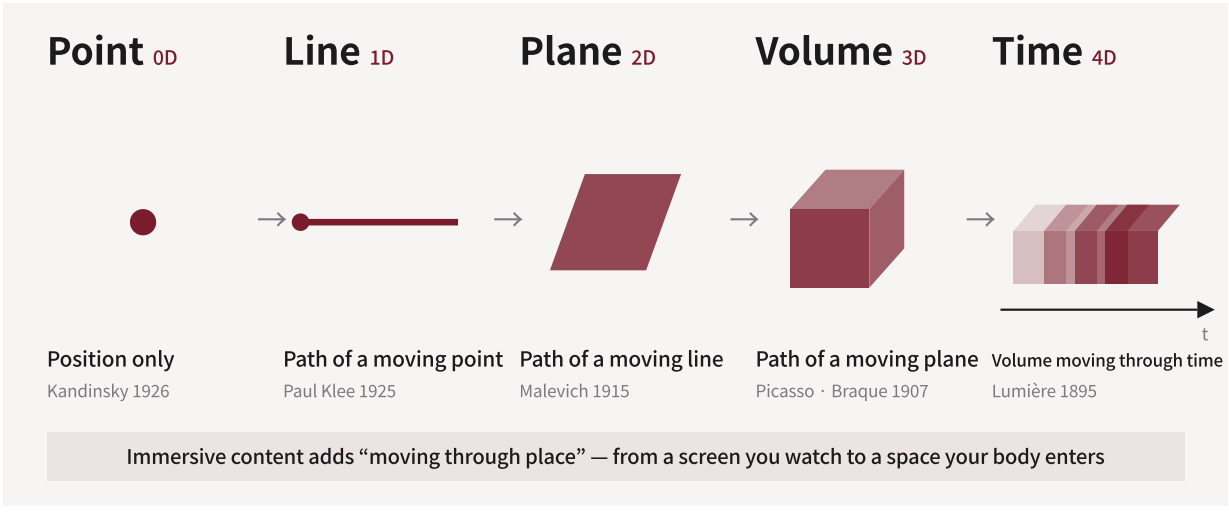


Figure 77 Dimensions of form — motion adds one dimension at a time. A moving point makes a line, a line a plane, a plane a volume, and a volume moving through time becomes video.

How immersive content uses each dimension

0	1	2	3	4	+
Point	**Line**	**Plane**	**Volume**	**Time**	**Moving through place**
A single light in the dark, a single particle. The strongest device for drawing the eye to one spot	Light trails, lasers, LED lines. They show direction and speed and guide movement	Screens, walls, floors, translucent scrims. Projection mapping turns a building's planes into screens	Volumetric lighting, hologram effects, anamorphic illusion. Make volume appear on a plane or create it in the air	Change and motion. The same space becomes an entirely different scene over time	The scene changes as visitors walk. Film moves place with cuts; in immersive space, the visitor's body moves place

> The more video moves from the flat plane into space, the more the planner designs the viewer's position instead of the camera's.
>
> 6.14 Video is space-time in motion

Video records 3D space on a 2D screen and adds time to set it in motion. Editing cuts and joins that space-time (1.20); immersive content brings the viewer's body inside it.

Artists and theory to read alongside

- Wassily Kandinsky, Point and Line to Plane (1926) — sets out the tension among point · line · plane as the basic grammar of form.
- Paul Klee, Pedagogical Sketchbook (1925) — describes the line as a point taking a walk: the idea that motion makes dimension.
- Kazimir Malevich, Piet Mondrian — Black Square (1915) and horizontal · vertical divisions of the plane: a picture of plane and color alone.
- Picasso and Braque's Cubism — layering many viewpoints in one picture to bring volume onto the plane.
- Marcel Duchamp, Étienne-Jules Marey — Nude Descending a Staircase, No. 2 (1912) and chronophotography put time and motion in one frame.
- Nam June Paik — video art that used TV sets as sculptural material, turning the screen into an object in space.
- Yayoi Kusama, James Turrell, teamLab — works of dots, light and space that viewers step into. The first references for planning immersive exhibitions.

A sentence to use on set

In an immersive content proposal, write first where visitors stand, where they walk and what they pass, before what you will show.

Exercise 6.14

Task	Express each of the five dimensions, point · line · plane · volume · time, in a 5-second video.
Tip	Vary one subject (e.g. a ball) across the five dimensions and the differences become clear.
Assessment	Accurate grasp of dimension, consistent expression
Model answer	Joins the five videos into one flow in which the dimensions build up.

PART 06 wrap-up

Exercises and review

01 Three aspect ratios

Make 16:9, 9:16 and 1:1 versions of the same material, placing the captions differently in each.

02 Measure UI overlay zones

Measure the UI-covered zones of the short-form platforms you use from real screen captures, and make a guide.

03 Flow plan and dwell-time chart

Pick a space on campus or nearby that could host an exhibition, and draw a floor-plan flow diagram and dwell-time chart.

04 Find an anamorphic corner

Find a building corner where the illusion could work, and sketch the reference viewpoint and a content idea.

One-page summary

6.1 Production specs by medium	A project started without a set platform always gets remade. Recheck the official guides before you begin.
6.2 Horizontal and vertical	Vertical is not a different medium but a different language. Long shots don't survive.

6.3 Safe areas	Check with a real upload, not the editing software's guides.
6.5 360 and VR	If the viewer never looked behind them, the plan failed. Preventing motion sickness comes before image quality.
6.7 XR exhibition halls	Divide 3600 seconds by the experience length, multiply by simultaneous capacity, and take 70% of that as the realistic figure.
6.9 Outdoor ads	Outdoor ads are silent by default. A plan that relies on sound has failed at the choice of medium.
6.10 LED signage	Terms like pixel pitch and nits make quotes more accurate. On transparent LED, black is transparent.
6.11 Viewing environments	When spanning several media, build first for the most constrained one. Expanding is easy; shrinking is hard.
6.14 Dimensions of form	In a proposal, write where visitors stand and where they walk before what you will show.

Questions to consider

Q **How big is the screen my video will play on, and how far away is the audience?**

Write down how those conditions change your shot sizes.

Q **What remains when I watch my video with the sound off?**

See why captions and graphics become the main carriers of the message in media that are muted by default.

Q **Self-check**

Check that you can explain why vertical video avoids long shots · how pixel pitch relates to minimum viewing distance · three ways to reduce motion sickness in 360 video · how to calculate hourly throughput · how shot sizes differ by viewing environment.

PART 07

An ad does not sell fifteen seconds.
It sells what stays after them.

PART

07

What you make in this PART

1. A 15-second ad structure analysis
2. A reference board (from 20 down to 5)
3. 1 ad of 15 seconds and a silent outdoor loop

Advertising production and case studies

How do you make an ad work and imprint a brand? The audience didn't come to watch ads. Learn the structure that wins attention, understanding and memory under these hostile conditions, and take apart the techniques of directors and production companies by asking why they did it that way.

Photo P-08 Product ad set with strip softboxes · generative image

Using this chapter in class

Design a 15-second structure and dissect references

Materials 3 ads to analyze, printed Worksheet 5

10 min	15 min	10 min	10 min	5 min
Opening	Concepts	Plates	Exercise	Wrap-up
Show only the first 3 seconds and ask whether they'd keep watching	15-second structure, 6 hook types, funnel and message	Pick one work from the case-study table and dissect it together	Fill in a reference cut analysis sheet	Explain how to keep building analysis notes

> Check point
>
> A note for every cut on why it was cut there

PART 07

Introduction

Advertising is the hardest form: it must move a stranger's heart in a very short time. The audience didn't come for the ad, and most are waiting for it to end. Having to leave something behind under these hostile conditions is what sets advertising apart from other video.

So advertising has a strict structure: grab attention, make it understood, make it remembered. In 15 seconds, these three stages get 3, 8 and 4 seconds. There must be one message; put in two and both vanish. This is not taste but a rule of thumb proven again and again.

The second half of this PART analyzes the techniques of directors and production companies. Not to copy them, but to understand why they did what they did. Learning starts the moment you pause an ad you like and write down why it cut here. Hitting like is not research.

Background 13

How ads are remembered

An ad's goal is not admiration in the moment of viewing but a memory that surfaces when it's needed. Designing an ad film is, in the end, designing the audience's attention and memory.

One of the oldest models is AIDA, credited to the American adman Elias St. Elmo Lewis in the late 19th century: attention, interest, desire, action. Many object that consumers don't follow these steps in order, but one point still holds: in a short ad, if you don't win attention first, the other stages never begin.

On memory, the German psychologist Hermann Ebbinghaus's forgetting curve is often cited. His experiments in the 1880s showed that newly learned information fades fast, but repetition slows the forgetting. That is why ads are repeated across many media. The mere-exposure effect Robert Zajonc described in 1968, the tendency to like what we see often, belongs to the same picture.

In How Brands Grow (2010), marketing scholar Byron Sharp described the key to brand growth as 'mental availability': how easily a brand comes to mind in a buying situation. Distinctive assets such as color, logo, sound, character and slogan must be repeated consistently, and the brand clearly linked within the ad. If an ad was fun but nobody remembers whose it was, it may have helped another brand.

Daniel Kahneman described human thinking as a fast, intuitive System 1 and a slow, analytical System 2. Short video ads work mostly on System 1: viewers take them in through feeling and impression rather than logic. The 'peak-end rule', that the most intense moment and the last moment of an experience shape the whole memory, is a good guide for designing an ad's climax and ending.

The hooks, message design, structures by length and brand imprinting in this chapter all rest on these principles of memory. When planning an ad, ask 'what will stay in the viewer's head a week later?' before 'what should we show?' Further reading — Byron Sharp, How Brands Grow; Daniel Kahneman, Thinking, Fast and Slow; Robert Cialdini, Influence.

PART 07 Advertising production and case studies

7.1 The basic structure of an ad

An ad is persuasion, not a story. Even when it uses narrative, the narrative serves persuasion, and the structure always passes through three stages: attention, understanding, memory.

Note An ad shoot — dozens of people spend a day on 15 seconds. Settle the structure first so that cost isn't wasted

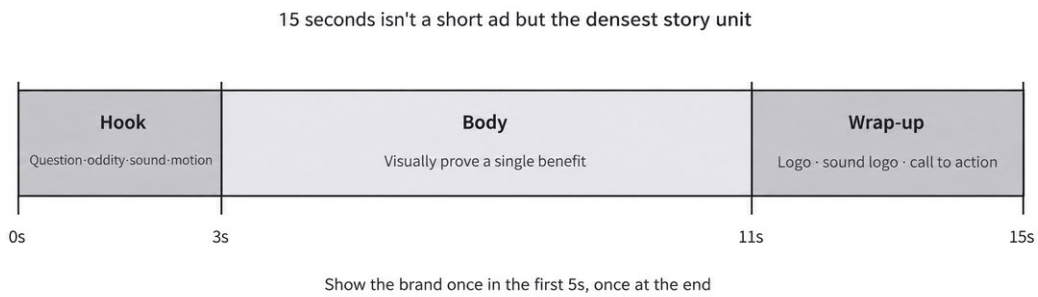

Figure 78 The standard structure of a 15-second ad

Length	Structure	Cuts	Messages	Brand exposure
6 s	Single scene + logo	2–3 cuts	1	At 4–6 s
15 s	Hook 3 s + development 8 s + close 4 s	5–8 cuts	1	1 early, 1 at the end
30 s	Opening 5 s + development 18 s + close 7 s	10–15 cuts	1 + 2 supporting points	1 midway, 1 at the end

Length	Structure	Cuts	Messages	Brand exposure
60 s	Situation + turn + resolution + brand	15–25 cuts	1 + narrative	Mainly at the end
3-minute brand film	Complete four-part arc	40+ cuts	Value proposition	End title

TIP

Put the longest cut in the close and the eye stays on the brand.

Standard 15-second structure

0–3 s

Hook

Open with a question, an odd image, a sound or a sudden movement. Open on the logo and drop-off soars.

3–11 s

Development

Prove visually just one benefit of the product. Put in two and both vanish.

11–15 s

Close

Land the brand logo, sound logo and call to action together.

> **What loses points**
>
> Listing information, too many captions and a late logo are the most common 15-second failures. In in-stream ads especially, showing the brand only at the end leaves nothing for viewers who skip.

Exercise 7.1

Task	Analyze 3 ads of 15 seconds each, splitting them into four segments: hook · development · brand · call to action.
Tip	Write each segment's start time in seconds.
Assessment	Accurate structural analysis
Model answer	Use the analyzed ratios to design your own ad's timeline.

PART 07 Ad production and case studies

7.2 3-second hook design

Cut out just the first 3 seconds, show them to someone, and ask if they want to keep watching. If not, the remaining 12 seconds are meaningless.

Note Hook — the first 3 seconds. A single finger snap stops the scroll

Six devices for the first 3 seconds

01 Visual anomaly
Something that shouldn't be there

02 Instant question
What's inside that?

03 Sudden motion
It spills, it bursts

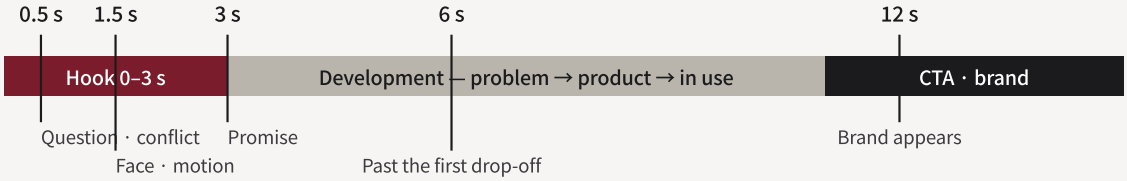
04 Sound break
Silence in a noisy place

05 Familiar situation
"That's me"

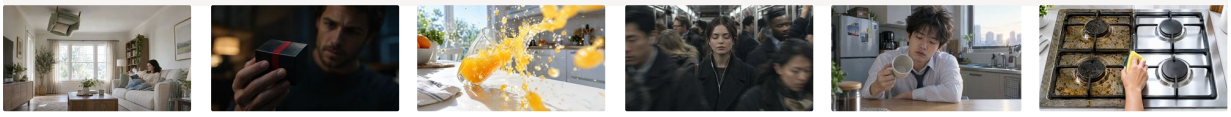
06 Result first
Show the ending first

Figure 79 Six devices for the 3-second hook — six ways to stop the scrolling finger with a single opening image. Pick one and use it in the first cut.

Hook timeline — the order that stops the scrolling hand within 15 seconds



Two doors where viewers leave: 1.5 s (scroll) and 6 s (skip button). Put a device before the first door and a promise before the second.
In vertical short-form, assume 0–1.5 s is everything, and put one line of captions on screen from 0 s.



Visual anomaly | Instant question | Sudden motion | Sound break | Familiar situation | Result first

Figure 80 Hook timeline — a question or conflict at 0.5 s, a face or motion at 1.5 s, a promise at 3 s. Below: six devices you can use in the first cut.

3 s	6 types	12 s
Decides whether they keep watching	Hook devices — pick just one	The rest, meaningless if the hook fails

Six devices

Visual anomaly
- A sight rarely seen in daily life
- Water flowing backward, odd scale, clashing colors

Instant question
- A short question on screen or in captions
- Makes viewers want the answer

Sudden motion
- A sudden move or zoom from a standstill
- Peripheral vision reacts first

Sound break
- Total silence or an unexpected sound
- Powerful for viewers with sound on

Familiar situation
- The target's everyday scene, as is
- Recognizing 'my story' holds the gaze

Result first
- The ending first, the process after
- Most effective in short-form

Don'ts

Note

To a muted viewer, an opening without captions is a blank screen.

Don'ts	Why
Opening on the brand logo	Instantly reads as an ad; drop-off spikes
Slow fade-in	Burns 1 of the 3 seconds with no information
Long setup	Scrolled past before it's understood
Intro animation	The deadliest structure in short-form
Opening with speech, no captions	A blank screen to muted viewers

Exercise
7.2

Task	Make the first 3 seconds of the same ad with 3 different hooks and show them to 10 friends.
Tip	Choose from a question, an unexpected image, sound, or a face close-up.
Assessment	Hook contrast, reaction log
Model answer	Analyze specifically why the best-received hook worked.

PART 07 Ad production and case studies

7.3 Marketing frames and message design

Once the goal is set, the metrics are set; once the metrics are set, editing decisions get easy. A 15-second spot that aims for awareness and conversion at once always fails.

Each stage calls for a different type of video and metric

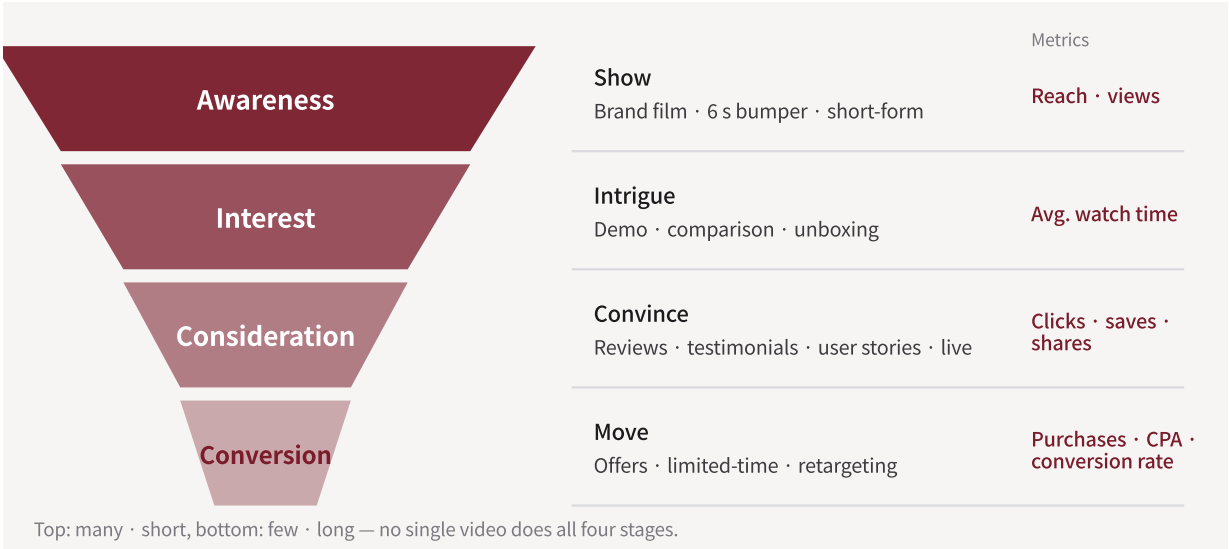


Figure 81 Matching the marketing funnel to video formats — each stage has its own role, format, and metrics.

AIDA

Attention · interest · desire · action

- The simplest skeleton of a 15-second ad

USP

Your one differentiator

- What competitors can't say
- Without it, it's an intro, not an ad

Funnel

Awareness · interest · consideration · conversion

- Each stage needs a different kind of video

Persona

One person, not a statistic

- Find scenes in that person's day

TIP

Even in student projects, pick only one goal.

Funnel stage	Purpose	Best format	Metrics
Awareness	Make the brand known	15 s brand film, bumper	Reach, views, completion rate
Interest	Explain the benefit	Demo, comparison	Avg. watch time, engagement
Consideration	Build trust	User reviews, testimonials	CTR, saves
Conversion	Prompt action	Offers, scarcity appeals	Conversion rate, CPA
Retention	Bring them back	How-tos, community content	Return visits, retention

Exercise 7.3

Task For one product, write a message in each of three frames: function · emotion · social value.

Tip Try cutting each message to one sentence of about 15 syllables.

Assessment Distinct frames, clarity of message

Model answer Dove, "Real Beauty Sketches" (2013). Find a message that changes people's perceptions, not one about product features.

PART 07 Ad production and case studies

7.4 Visual design by Korean directors

We look at how directors and production companies design the frame. Not to copy them, but to understand why they did it. Each entry only takes on meaning when you pause a scene from a signature work and check it yourself.

Park Chan-wook
- Precise symmetry, strong color contrast, theatrical mise-en-scène
- Camera moves that cross the space and reveal the psyche
- In ads: dramatic premium-product reveals

Bong Joon-ho
- Class shown through verticals and stairs
- Precisely calculated blocking
- In ads: contrast-based setups, twist structures

Hong Sang-soo
- Static shots and slow pacing, sudden zoom-ins mid-conversation
- Mostly natural light
- In ads: low-budget realism, interview formats

Lee Chang-dong
- Long takes, little explanation
- Camera trailing the character
- In ads: emotional, story-driven brand films

Ryoo Seung-wan
- Fast-paced action editing, physical realism
- In ads: sports, mobility, dynamic products

Dolphiners Films (Shin Woo-seok)
- Lets the product exist inside a world of its own
- Exaggeration played straight to the end, variation after repetition
- Detail gags in the corners of the frame, self-awareness that doesn't hide the ad

Anatomy of the comedy

World-building
- Builds a world of its own instead of explaining the product
- Can expand into a series

Consistent exaggeration
- Unreal premise, played dead straight
- Half-hearted exaggeration is worst

Rhythm and repetition
- Repeat one structure, vary it at the end
- Music and cutting time the laughs

Detail gags
- Elements in the corners that invite rewatching
- A reason to rewatch and share

Self-awareness
- Shows openly that it's an ad
- Turns resistance into laughter

Craft
- Backs the idea with high production craft
- Sloppy execution looks amateur

Designing comedy, step by step

01 Lock
Lock the premise in one sentence

02 Rules
Set the rules the premise will keep

03 Repeat
Repeat the rules so the audience learns them

04 Break
Break the rules at the end

Signs of failure

Only the makers laugh; the audience doesn't get it · The fun hides the product · Relies only on buzzwords and memes · Craft can't keep up with the idea

When analyzing a case, don't just record the funny scenes; also record when and how the brand appears.

> Laughter is a means, not an end. If the brand isn't remembered after the laugh, the ad has failed.
>
> 7.4 Visual design by Korean directors

Exercise 7.4

Task	Pick 3 ads · music videos by one Korean director and find the recurring visual design.
Tip	Break it down into color, composition, camera movement, and editing rhythm.
Assessment	Well-founded style analysis
Model answer	Submit stills that apply the rules you found to your own work.

PART 07 Ad production and case studies

7.5 Composition principles of world masters

Read the structural principle behind each signature technique, and see where in advertising it could be carried over.

TIP

This is applying principles, not imitating. Don't recreate the original frame as is.

Director

Stanley Kubrick

- One-point perspective symmetry
- A centered vanishing point overwhelms
- In ads: centered product, logo cut

Director

Wes Anderson

- Flat frontal framing, controlled palette
- Color and symmetry build the world
- In ads: brand-color-led spots

Director

Denis Villeneuve

- Compositions of scale with tiny figures
- Spatial contrast creates awe
- In ads: large products, spatial campaigns

DP

Roger Deakins

- Single source and silhouette
- One light direction makes the scene
- In ads: premium lighting on a low budget

Director

Michel Gondry

- Live-action analog tricks
- Effects completed on set
- In ads: practical effects, not compositing

Director

Christopher Nolan

- Practical shooting, time-structure experiments
- Physical realism, editing structure
- In ads: proof-by-experiment spots

Exercise
7.5

Task	Pick one master's composition principle and shoot 3 stills on the same principle.
Tip	It must be an application of the principle, not an imitation.
Assessment	Grasp of the principle, original use
Model answer	Explain why the principle applies, in the context of your own story.

PART 07 Ad production and case studies

7.6 Reference research methods

Define › collect › deconstruct › structure › translate › differentiate. A reference you don't take apart ends as imitation.

01	02	03	04	05	06
Define	**Collect**	**Deconstruct**	**Structure**	**Translate**	**Differentiate**
Decide first: lighting or rhythm? → 1–2 research questions	10 or more examples with the same aim → reference list	Pause cut by cut; log size · angle · lighting · length → cut analysis sheet	Sort common patterns and exceptions → pattern list	Rewrite for your own material and budget → workable plan	Decide what you won't copy → 1 point of difference

Three analysis questions

01 What did it show in the first 3 seconds? Why that choice?

02 At what second does the brand first appear? Why then?

03 Where is the most expensive cut in this ad, and could you do without it?

> **A reference you don't take apart ends as imitation**
>
> Learning starts the moment you pause a scene and write down why it was cut there. Hitting 'like' is not research.

Exercise
7.6

Task	For one assignment, collect 20 references, narrow them to 5, and make a reference board.
Tip	For each reference, write in one word what you're taking from it (color, composition, pace).
Assessment	Selection rationale, source credits
Model answer	Sort out what the references share and how they differ, and derive your own direction.

Background 14

The logic of copyright

Borrowing is not making. Copyright is not a rule to block creation but a social contract to keep it going. Copyright protects expression, not ideas. This is the idea-expression dichotomy. The idea of 'a story that turns back time' is open to anyone, but a specific work's dialogue, scene construction, and editing rhythm belong to that work. To use a reference means to learn its principles, not to copy its frames.

Korean copyright law separates economic rights from moral rights. Economic rights cover reproduction, performance, public transmission, distribution, the making of derivative works, and more, and they can be transferred. Moral rights, such as the right of attribution and the right of integrity, stay with the creator and cannot be transferred. A commissioning contract may say 'all rights are transferred' and moral rights still remain, so in practice a separate agreement not to exercise them is common.

Video stacks several layers of rights. To use one song, you must clear both the copyright in the music and lyrics and the neighboring rights in the recording. 'I bought the track' usually means a license to play it, which is not the right to put it in a video. Performers' faces and voices carry likeness rights and publicity interests, and a location may need the facility manager's consent. Fonts, logos, even a poster that happens to land in the background can be subject to rights.

Fair use is the clause that handles exceptions. Article 35-5 of the Korean Copyright Act provides that, for uses such as reporting, criticism, education, and research, the purpose and character of the use, the type of work, the share of the work used, and the effect on the market be weighed together. It is not an automatic exemption but a standard judged after the fact. The folk rule that 'up to a few seconds is fine' has no basis. Quote only as much as you need, cite the source, and do not replace the original's market.

Generative AI adds new questions. The legality of training data, the authorship of outputs, and outputs that imitate a particular creator's style are under debate in many countries. Many countries, Korea included, have taken the position that output without human creative contribution can hardly be copyrighted. Make a habit of recording the tools and prompts you used and the extent of human involvement. In this book's plates, too, the diagrams were designed by the author, while the figure drawings and ref-

erence images were made with generative AI; the terms are set out in the appendix.

Three habits protect your practice. First, record the source and scope of use for every asset you use. Second, check the contract for the scope, term, media, and territory of the rights. Third, if in doubt, don't use it, or ask permission. Most copyright disputes start not from malice but from missing records. Further reading — Korea Copyright Commission, Copyright Made Easy: 100 Consultation Cases; Copyright Act, Article 35-5; Lawrence Lessig, Free Culture.

PART 07 Ad production and case studies

7.7 Copyright and production ethics

Learning a technique is different from taking a frame. The table lists, for each type of asset, the rights to check and how to handle them.

Allowed

- Learning techniques: lighting setups, angles, editing rhythm
- Using genre conventions and grammar
- New expression drawing on an idea's structure
- Sharing references in internal meetings
- Quoting for criticism and analysis

Not allowed

- Using frames from a reference video as is
- Unlicensed music, fonts, or stock assets
- Recreating another ad's cut structure and copy
- AI copies of a specific work's frames
- Excusing unauthorized use with a credit

Note

Even if it's free, check the scope of use (commercial, modification, attribution).

Asset type	Rights to check	In practice
Music	Copyright and neighboring rights	Keep proof of license purchase
Fonts	Scope of commercial and video use	Check license terms; free alternative typefaces
Stock footage and images	Scope of use, resale limits	Check for editorial-only status
Performers	Likeness and publicity rights	Get a signed release
Locations	Location rights, trademark exposure	Location permit, cover logos
AI output	Training data, terms of use	Check commercial-use terms

Asset type	Rights to check	In practice
Minors on camera	Guardian consent	Written guardian consent

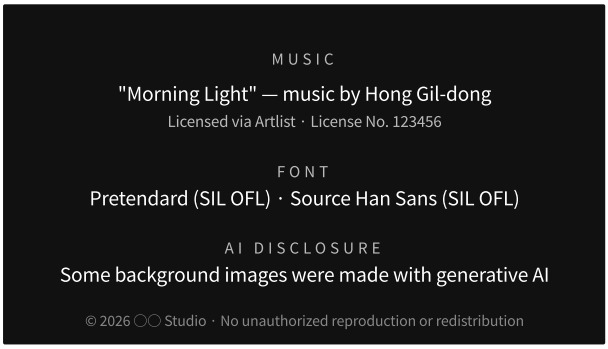
How it looks on screen, and where and how to credit it

✕ As is — brands visible on cup · cap · sign

Unauthorized third-party brands run afoul of both broadcast review and trademark law

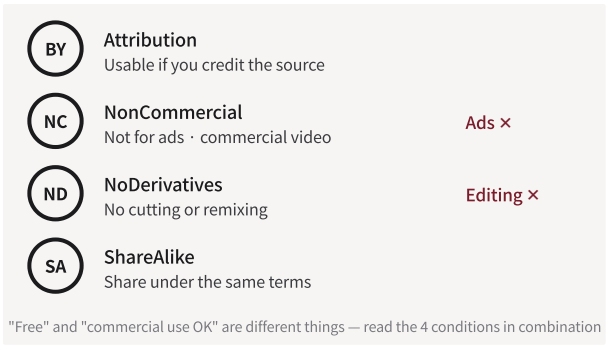
○ Treated — removed, covered, or blurred

Taking it off the prop before shooting is cheapest. Fixing it in post costs per cut



Sample end credits

Music — title · composer · license source and number / Fonts — typeface and license / AI disclosure / Copyright notice



How to read CC licenses

With BY alone, you can use it in ads; with NC, you can't. With ND, you can't even cut it

Frequently cited disputes

"Blurred Lines" (2015, US) — about $5.3 million in damages for resembling a song's mood and groove. A 'feel' can be plagiarism too

Font licenses — in Korea, every year people use freely distributed fonts in videos · ads and then face settlement demands under 'no commercial use' terms

YouTube Content ID — just 10 seconds of music in the background can send the revenue to the rights holder or get the video blocked

Likeness — if a passerby's face is identifiable in street footage, it can't be used in an ad without consent. Blur it or get a release

Figure 82 Copyright credits and clearance in practice — handling visible brands, end-credit notation, reading CC licenses, and recurring types of dispute. A credit is not immunity but proof that you "checked."

Masterpieces out of copyright — material ready for media works

Leonardo da Vinci, "Mona Lisa"
1503–06 · Louvre

Botticelli, "The Birth of Venus"
c. 1485 · Uffizi

Vermeer, "Girl with a Pearl Earring"
1665 · Mauritshuis

Rembrandt, "The Night Watch"
1642 · Rijksmuseum

Hokusai, "The Great Wave off Kanagawa"
c. 1831 · woodblock print

Kim Hong-do, "Ssireum"
18th c. · National Museum of Korea

Shin Yun-bok, "Dano Festival"
late 18th c. · Kansong Art Museum

Van Gogh, "The Starry Night"
1889 · MoMA

Van Gogh, "Sunflowers"
1889 · Van Gogh Museum

Munch, "The Scream"
1893 · National Museum, Oslo

Klimt, "The Kiss"
1907–08 · Belvedere

Where to get them

National Museum of Korea e-Museum (KOGL Type 1) · The Met Open Access · Rijksmuseum Rijksstudio · Art Institute of Chicago · Paris Musées · Wikimedia Commons. A work enters the public domain 70 years after the artist's death, but a museum's recent photographs may carry their own terms, so check each site's license label (CC0 · KOGL).

This is why Van Gogh · Klimt media art shows are possible. The works now belong to the public, and what remains is **interpretation** — which part to enlarge, in what order to move it, what sound to lay over it.

Figure 83 Eleven public-domain masterpieces — all made before 1929 and free for copying · adaptation · commercial use (photos: Wikimedia Commons, museum releases).

Exercise 7.7

Task	Make a rights checklist for the music, fonts, images, and people in your work.
Tip	Even if it's free, check the scope of use (commercial, modification, attribution).
Assessment	Complete rights clearance
Model answer	Keep license proof links together with likeness releases.

PART 07 Ad production and case studies

7.8 How to read case studies

Watching a work is not the same as analyzing it. What to look at is not the box-office figure but the choices that produced it.

The cases below are not a viewing list but samples for checking how specific techniques and decisions led to results.

- Budget and box-office figures vary by source and by whether re-releases are included. Figures here are widely cited approximations; check the original sources if you need exact numbers.
- For each case, write one line on what you could carry into your own project.

Note

Award years are the years the ceremonies were held.

> **Without that line, it's appreciation, not analysis**
>
> Read each case through 'problem → strategy → execution → result', and clearly write down one principle to bring into your own work.

Exercise 7.8

Task	Summarize one case study on 1 page using the 'problem → strategy → execution → result' frame.
Tip	Always check the source of result figures.
Assessment	Logical structure, fact-checking
Model answer	Clearly state one principle from the case to bring into your own work.

Background 15

When technology changed form

New equipment has always produced new images. Here are five such moments. The first is sound. After "The Jazz Singer" in 1927, as sync sound became standard, the noisy camera was shut away in a soundproof booth, and early talkies actually turned visually stiff. Only after the blimp and the boom mic were developed could the camera move again. This order, in which a new

technology first constrains expression and later frees it, would repeat from then on.

The second is film speed and lenses. Deep-focus shooting in the 1940s required stopping down for a deep depth of field, which in turn demanded a lot of light and fast film stock. That figures in front and behind are sharp at once in "Citizen Kane" was both an aesthetic choice and a result of technology. The audience chooses where to look, and the characters' relationships are revealed through composition.

The third is the lighter camera. As portable sync-sound equipment spread in the late 1950s, cinéma vérité in France and direct cinema in the US emerged. Once the camera went out into the streets, shaky frames and improvised compositions began to read as the mark of the real. The handheld look of today's variety shows and vlogs inherits that convention.

The fourth is the digital intermediate and color grading. In the early 2000s, as the process of scanning film to digital, grading it, and transferring it back to film took hold, it became possible to redesign a whole scene's color in post-production. This is where color became a work's signature, as with teal-and-orange contrast. Today it is common to set the look at the shooting stage and apply it to the monitors on set.

The fifth is the smartphone and the vertical screen. As shooting, editing, and distribution came to be done on one device, production cycles shortened, and the vertical frame made people-centered close-ups and fast cuts the default. Captions stand in for sound, and the first 3 seconds govern the whole structure. It is not that the aspect ratio changed; the audience's viewing posture and setting changed.

There is a common lesson. Technology does not decide form, but it changes the range of what is possible. Those who explore that range first create the grammar of the next generation. When you read a case, ask not only 'what was used?' but also 'what did that equipment make possible?' Further reading — David Bordwell · Kristin Thompson, Film History: An Introduction; Barry Salt, Film Style and Technology; John Belton, American Cinema/American Culture.

PART 07 Ad production and case studies

7.9 Film: technology and form

These are cases where technology changed form. Technology has never come first with the story following. Once you decide what you want to show, technology falls into place as a means.

Note

Film set — gear and people gather to make a single stream of rain. Technology always comes after the scene you want to show

Note

Budgets and box office are widely cited approximations.

James Cameron

Titanic (1997)

- Budget about $200M · gross about $2.1B
- Full-scale sets, miniatures, early CG crowds
- 11 Academy Awards

The Wachowskis

The Matrix (1999)

- Budget about $63M · gross about $460M
- Bullet time
- A moving shot that freezes time using an array of still cameras

Jon Favreau

Iron Man (2008)

- Budget about $140M · gross about $580M
- A practical suit mixed with CG
- Template for the later franchise

James Cameron

Avatar (2009)

- Budget about $240M · gross about $2.9B
- Performance capture and virtual camera
- Made 3D screenings mainstream

The Russo brothers

Avengers: Endgame (2019)

- Budget about $360M · gross about $2.79B
- Payoff of a world built over a decade
- Digital de-aging

Jon Watts

Spider-Man: No Way Home (2021)

- Budget about $200M · gross about $1.9B
- Showed theatrical demand recovering after the pandemic

James Cameron

Avatar: The Way of Water (2022)

- Budget about $350M · gross about $2.3B
- Underwater performance capture
- High-frame-rate screenings

What to learn here

Bullet time began with the directorial intent to stop time; performance capture came from the wish to put an actor's expressions on the face of another species.

Exercise 7.9

Task	Pick a film whose form was changed by a technology, and write how the same scene would turn out without that technology.
Tip	Focus on the relationship between technology and story.
Assessment	Depth of analysis
Model answer	The seemingly continuous take of "1917". Explain how the technology changed the audience's experience.

PART 07 Ad production and case studies

7.10 Korean film: the director's signature

Park Chan-wook and Bong Joon-ho both use mise-en-scène, but for opposite purposes. If you can tell the difference, you'll pick references far more precisely.

Park Chan-wook

Oldboy (2003)

- Cannes Grand Prix (2004)
- Symmetry, strong color contrast
- Lateral long take in the hammer corridor scene

Park Chan-wook

Decision to Leave (2022)

- Cannes Best Director (2022)
- Gaze matched to the frame
- Digital interfaces integrated into the frame

Bong Joon-ho

Parasite (2019)

- Palme d'Or (2019), 4 Academy Awards (2020), about 10.31M admissions in Korea
- Vertically structured space
- Stairs and height make class visible

Lee Isaac Chung

Minari (2020)

- Academy Award for Best Supporting Actress, Youn Yuh-jung (2021)
- Natural light, restrained camera
- Observer's distance

Bong Joon-ho

The Host (2006)

- About 13M admissions in Korea
- Genre blending
- Spectacle in everyday spaces

Yeon Sang-ho

Train to Busan (2016)

- About 11.56M admissions in Korea
- Designing rhythm in a confined space

Mise-en-scène

The design of what to put in the frame and how. Some styles reveal it; others hide it.

Park Chan-wook's frames, with left-right symmetry and artificial color, don't hide the fact that 'this image is constructed'. Bong Joon-ho, by contrast, designs frames to look natural but plants meaning in differences of height within the space.

What the frame says — three works broken down

Bong Joon-ho · 2019 · film

Parasite

- Vertical space is class — the semi-basement, the stairs, the height of the hilltop mansion
- Their climbs and descents are the story
- Blocking several characters within long takes reveals their relationships

Hwang Dong-hyuk · 2021 · series

Squid Game

- Color code — pink guard suits and green tracksuits mark roles instantly
- The scale of the giant sets creates the games' terror
- Rules explained through visual design (shapes, stairs, space) instead of dialogue

Lee Isaac Chung · 2020 · film

Minari

- Natural light and long takes let time on the farm flow as it is
- Translates the distance between family members into camera distance
- Intimate close shooting inside the small house and trailer

Directors' signatures — more

Hong Sang-soo

Minimalism of improvisation and repetition

- Writes the script the morning of the shoot and films with a fixed camera · long takes · zooms
- Same actors, same drinking scenes, small variations — "On the Beach at Night Alone" (2017 Berlin, Best Actress), "The Woman Who Ran" (2020 Berlin, Best Director)
- Why he's loved: on a minimal budget, he proves how small "the unit of one film" can be

Park Chan-wook

"Thirst" (2009)

- Cannes Jury Prize. A priest turned vampire — desire and guilt rendered in color and texture
- The physicality of the blood-drinking scenes (blood · water · glass), symmetrical framing, and sudden black humor
- Lesson: how to borrow genre conventions to say something completely different

Hwang Dong-hyuk

"Squid Game" (2021)

- Most-watched Netflix series ever; 2022 Emmys for directing · lead actor
- Children's games × survival — the primary-color sets (pink stairs, green tracksuits) are the brand
- Lesson: the simpler the rules, the greater the tension. The production design tells the story

Lee Isaac Chung

"Minari" (2020)

- Sundance Grand Jury Prize · Audience Award; 2021 Academy Award for Best Supporting Actress (Youn Yuh-jung)
- An autobiographical story; natural light and a soft, 35mm-like look; family distance expressed in shot sizes
- Lesson: a small story grows bigger when shot small

Steven Spielberg

Directing by not showing

- "Jaws" (1975) — not showing the shark because it kept breaking down became the invention of fear
- "Schindler's List" (1993) — a single red coat in black and white. The child's-eye-level camera of "E.T."
- Lesson: how to use the audience's imagination; eye level sets the emotion

Christopher Nolan

Shoot it for real

- The practical rotating-corridor set of "Inception"; Academy Awards for Best Picture · Best Director for "Oppenheimer" (2023)
- "The Odyssey" (2026) — a new film known for large-scale location shooting centered on IMAX film cameras
- Lesson: even when CG could do it, shooting it for real changes the actors and the light

Exercise
7.10

Task	Find one Korean film director's signature (recurring scenes, compositions, themes) and make a 2-minute video essay.
Tip	Keep quoted footage to the minimum the critique requires, and credit your sources.
Assessment	Original analysis, apt quoting
Model answer	Show the same composition from several works side by side to prove the director's way of seeing.

PART 07 Ad production and case studies

7.11 Animation: principles accumulated

Animation systematized the principles of moving images before live action did. The 12 principles are the result, and the easing and anticipation in motion graphics and ads all come from there.

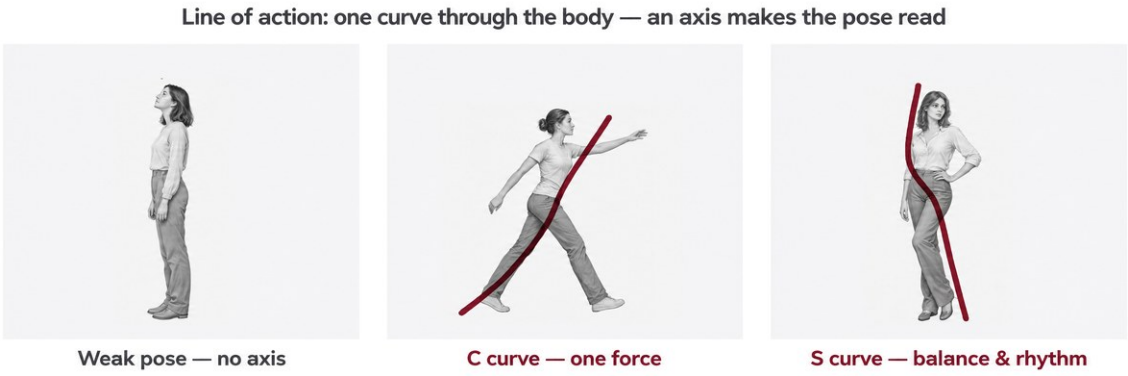


Figure 84 Line of action — a single curve running through the pose

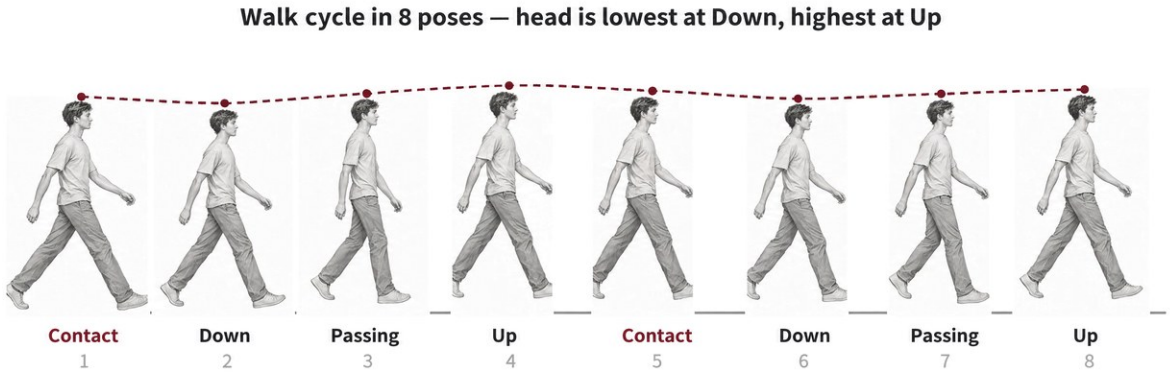

Figure 85 One walk cycle in 8 poses

Disney · 1940

Fantasia

- Music combined with abstract animation
- Multichannel sound experiment

Disney · 1991

Beauty and the Beast

- Introduced digital coloring
- First animated film nominated for Best Picture

Pixar · 1995

Toy Story

- First fully computer-animated feature
- Start of the 3D animation industry

DreamWorks · 2001

Shrek

- Won the 1st Academy Award for Best Animated Feature (2002)
- Parody of fairy-tale conventions

Erick Oh · 2020

Opera

- A single-channel work layering hundreds of stories in one frame
- Academy Award nominee, Best Animated Short (2022)

Pixar · 2020, 2015

Soul, Inside Out

- Visualizing abstract concepts
- Designing emotion with color and shape

Note Animation studio — the 12 principles are tested every day on the storyboards pinned at every desk

TIP

Watch at 0.25x speed or step frame by frame.

Even if you only do live action, frames made by someone who knows animation's principles look different from those made by someone who doesn't.

Exercise 7.11

Task	Pick one animated scene and mark, frame by frame, where the 12 principles are used.
Tip	Use 0.25x speed or frame-by-frame stepping.
Assessment	Accurately identified principles
Model answer	Make a version without the principle yourself to prove the difference.

PART 07 Ad production and case studies

7.12 OTT and drama: the power of structure

The clearer the episode structure, the better it does in the global market. For each case, find the device that makes you watch the next episode.

Note Drama set — the clearer the episode structure, the faster the set moves. Everyone knows where today's scenes sit in the whole

Netflix · 2021

Squid Game

- 6 Emmys (2022)
- Color and space as signs
- Clear repetition: one game per episode

Netflix · 2022–2023

The Glory

- A revenge plot paid off in stages
- Cold tones, static framing

NBC · 1994–2004

Friends

- Multi-cam sitcom grammar
- 3–4 cameras shooting at once, audience reactions recorded

MBC · 2009

High Kick Through the Roof

- Recurring everyday spaces, layered characters
- Efficient use of a single set

MBC · 2009

Queen Seondeok

- Large period-drama scale combined with character close-ups
- Peak ratings in the 40% range

Multi-cam

Shooting with several cameras at once instead of moving one. The lighting becomes flat, but production is overwhelmingly faster.

— YouTube talk content took over the multi-cam sitcom method wholesale for one reason: speed.

— In Squid Game, color is a rule, not decoration. Green for the players, pink for the staff: color is role, and it built a structure you understand without knowing the language.

Exercise 7.12

Task	Break one drama episode down into opening, conflict, twist, and ending hook.
Tip	Look especially closely at the last 1 minute, which makes you watch the next episode.
Assessment	Structure analysis, grasp of the ending hook
Model answer	Use the analyzed structure to plan episode 1 of a 5-minute web drama.

PART 07 Ad production and case studies

7.13 Social media: built to be discovered

On YouTube and social media, what performs is a structure built to be discovered, not just made. What makes institutional social media succeed is not budget but authority. The more approval steps, the more ordinary the content.

Reference photos 7.13A Where it's made, where it's found

Note

YouTube studio — one small room is the whole channel. A fixed setup keeps the upload schedule

Note

Short-form — built to be discovered. With a first line and a rewatch device, even a video shot in a kitchen rises in the feed

Large-scale stunt entertainment

MrBeast

- Stakes and rules in the first 10 seconds
- Reverse planning: title and thumbnail first, then the content

Explainer documentary

Veritasium and other science channels

- Starts with a question, then disproves
- Visual experiments are the evidence

Institutional archive

NASA's channel

- Raw material is the content
- Translates press releases into video

Institutional social

National Museum of Korea's social media

- Recasts the collection as memes and merch
- Less authority, accurate information

Local government social

Chungju City's PR channel

- One-person production, low budget, self-satire
- Turns rough form into the concept

What makes institutional social media succeed

What the Chungju City and National Museum of Korea cases share is that the person in charge was given the authority to set the tone. If you end up running a department or institutional account, the first thing to agree on is not the budget but the decision-making structure.

Exercise 7.13

Task	Redesign 3 short-form videos on your channel for discovery (thumbnail, first line, rewatch device).
Tip	The first line is understood faster when the on-screen caption and the voice say the same thing.
Assessment	Before/after comparison, metric changes
Model answer	Capture view retention before and after the changes to verify the effect.

PART 07 Ad production and case studies

7.14 Advertising: the architects of 15 seconds

As a leading example of work that changed how Korean ads speak, we look at Dolphiners Films (director Shin Woo-seok). The premise changes with each campaign, but the structure stays consistent.

01 Builds a world of its own first instead of explaining the product. Lets the audience learn that world's rules.

02 Pushes an unreal premise with a straight face to the end. Half-hearted exaggeration is the most awkward.

03 Repeats one structure, then varies it at the end. Music and cutting rhythm set the timing of the laughs.

04 Plants details in the corners of the frame that invite rewatching. They become reasons to rewatch and share.

05 Doesn't hide that it's an ad; it shows it, turning resistance into laughter.

06 Backs the idea with high production craft. Sloppy execution looks amateur.

TIP

One message only. The brand once within 5 seconds, and once more at the end.

Exercise 7.14

Task	Plan · shoot · edit a finished 15-second ad.
Tip	One message only. Show the brand once within 5 seconds and once more at the end.
Assessment	Single message, brand recognition, craft
Model answer	Volvo Trucks, "The Epic Split" (2013). Prove a product's function in one dramatic scene.

PART 07 Ad production and case studies

7.15 Music videos and K-culture

A music video can do without narrative, but it has to hold up on rhythm, color, and composition alone. It's the best format for training in compressed film grammar.

2012
PSY's Gangnam Style
- One repeated move crossed borders
- First on YouTube to pass 1 billion views

2020–
BTS's Dynamite and others
- Full shots of the group choreography intercut with facial close-ups
- Multilingual subs and a fan-sub ecosystem

2016–
BLACKPINK
- Saturated sets and costumes, a color for each member
- Short cuts and strong symmetrical composition

2012–
G-Dragon
- An auteurist approach that puts art and fashion up front
- Art direction stands in for narrative

Three formulas, read through structure

AKMU · 2026
Paradise of Rumors
- An ensemble of twenty-four people dancing to their own rhythms in one open field
- The members appear for only about 40 s of 3 min 37 s — the stars step aside and the space becomes the star
- Not razor-sharp unison but a crowd of mixed personalities — the Background reading's mood, put on screen

PSY · 2012
Gangnam Style
- The same dance repeated across ever-changing locations — the place changes, the move stays
- One dance move became a meme, and imitation drove the spread
- The first case of YouTube turning the music video into a global distribution network

BTS · BLACKPINK and the like
The big-set MV formula
- Solo cuts per member + group-dance wides + set changes, on repeat
- Each chorus brings a new set and new colors, so you hear the rhythm with your eyes
- Solo cuts designed to become material for fans' fancams · edits

Cameras on music shows

Weekly music shows such as Music Bank, Inkigayo and M Countdown run on the grammar of multicamera live broadcasting. A jimmy jib sweeps overhead, a Steadicam slips between formations, and a rail

camera runs in the same direction as the choreography. The camera operators' paths are designed together with the choreography once it is set, and in effect become part of it.

As fancams that follow a single member have become content in their own right, stages are now built to serve broadcast cuts and fancam full shots at once. When an ad shoot involves choreography or movement, you can borrow this grammar as is.

Reference photos 7.15A Four K-pop video sets

Note

K-pop music video set — in a group-dance wide, the scale of the set is the power of the image

Note

Music show — the camera dances too. The operators' paths are part of the choreography

Note

Performance music video — no story; color, light and rhythm alone carry 3 minutes

d

Music show sub-control room — the switcher picks cuts from the multiview, 8–12 cameras on one screen

Note

Group dance needs full-body shots, so it is hard to repurpose for vertical screens.

— Shooting a separate vertical version has become industry practice.

— Fan-made derivative works often reach further than the original. Design with room left for remixes and challenges.

Stage and music video — each agency's directing language (observations)

SM

Dense worldbuilding and performance

- High-saturation · futuristic sets; razor-sharp unison held long in frontal wides
- Worldbuilding (story) teasers — music videos continue like a series
- Stage: lighting cues designed 1:1 with choreography points

YG

Texture and attitude

- Hip-hop · street — rough textures, black · gold · neon, a few figures in wide spaces
- The camera follows the performer's attitude — slow motion and low angles
- Stage: big LED screens and practical effects like fire · smoke

JYP

Pop and clean

- Bright color blocks, clean lighting, mostly medium shots that show the choreography clearly
- The chorus's signature move becomes the thumbnail — designed for challenges
- Stage: camera moves matched in advance to the choreography's paths

HYBE (Big Hit)

Narrative and fan participation

- Cinematic look — anamorphic flares, locations, slow-burn narrative music videos
- Content expands beyond the album (docs · games · webtoons) — fans are left to interpret
- Stage: drones · cranes · multicam, aiming for "video better than being there"

Theater — what five musicals teach video

Les Misérables — revolving stage and live recording

Vertical composition in the barricade scene. The 2012 film recorded the songs live on set to keep every breath

Chicago — the form is the theme

The trial is staged as vaudeville. The 2002 film won Best Picture — it solved the film-grammar problem by moving the numbers onto an "imagined stage"

The Lion King — masks and puppets

A "double event": the actor's face and the animal mask seen at once. Direction that trusts the audience's imagination over technology

Moulin Rouge! (2001 · stage 2019)

A jukebox musical — it reweaves existing pop. The film builds a "drunken night" from cuts under 1 second and exaggerated color; the stage wraps even the audience in red light

Lesson: editing rhythm is emotion. Fast cuts can create rapture, not confusion

Wicked (stage 2003 · film 2024–25)

The green-pink complementary contrast maps the two characters' relationship. The film insisted on really planted tulip fields and physical sets instead of CG

Lesson: when color explains character, dialogue shrinks. Real light is hard for CG to imitate

Figure 86 Theater examples — the stage has no camera, so it moves the audience's eye with light and placement. What a video director learns from the stage is "how to design the gaze within one frame." The photos are generated images recreating the mood.

Exercise
7.15

Task	Analyze the cut rhythm of a music video you like against the beat of the music.
Tip	Mark the edit points on the audio waveform.
Assessment	Precision of the rhythm analysis
Model answer	Separate cuts on the beat from cuts deliberately off it, and explain the effect of each.

PART 07 Advertising production and case studies

7.16 Length sets the form

From 6 seconds to 90 minutes, a video's length is not mere duration but the form itself. The shorter it is, the more you boil it down to one message; the longer, the more characters and relationships you need.

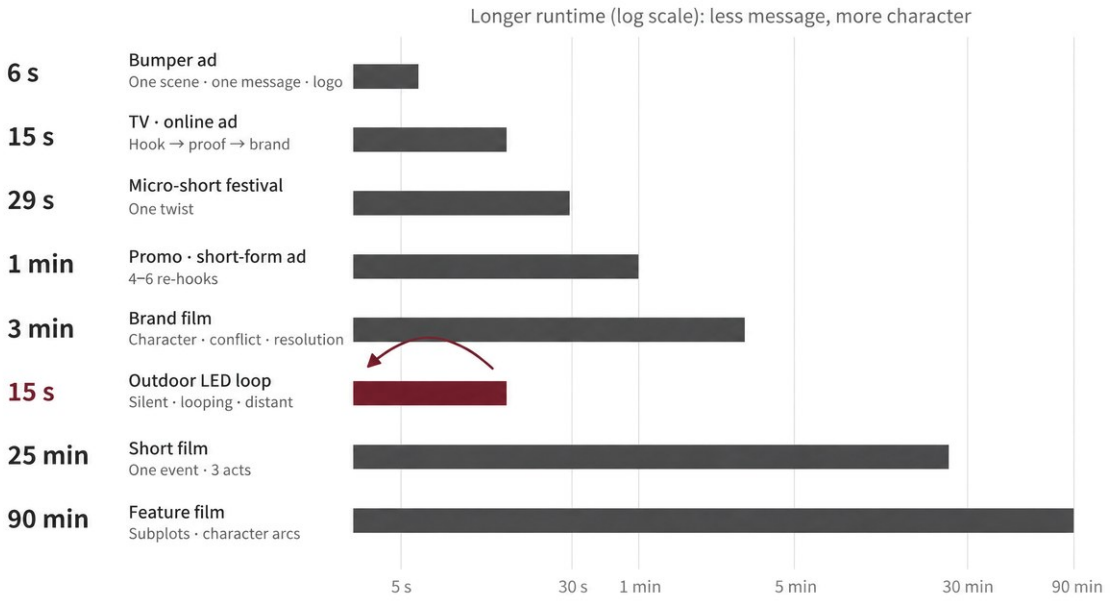

Figure 87 Video forms by length — shorter means one message, longer means deeper characters

Short forms

5–6 s

Bumper

Skippable ads show the skip button after 5 seconds; bumpers run 6 seconds or less and can't be skipped. One scene, one message, a logo. Brand and key image must all appear within 5 seconds.

15 s

Basic unit

The standard for TV and online ads. A 3-part structure: hook (0–3 s) → proof (3–12 s) → brand and call to action (12–15 s).

29 s

Micro-short

In under-30-second contests such as the 29-Second Film Festival, a single twist is everything. Setup in one cut, twist in the last 5 seconds.

1 min

Short-form

The standard for ads and promo videos. Re-hook every 8–10 seconds to give a fresh reason to watch to the end (see 7.17).

Long forms

3 min

Brand film

A common length for institutional promos. One person, one conflict, one resolution. People's stories come before the product.

10–30 s

Outdoor LED loop

Plays on repeat without sound. The end must flow into the start, and it must read from afar within 3 seconds (see 7.19).

25 min

Short film

The typical length for festival entries. One event in 3 acts, one change in the protagonist. A cast of 3–4 at most is safest.

90 min

Feature

Main plot and subplots interweave, and inner change moves with outer events. The benchmark is a screenplay of about 90–110 pages.

Reference photos 7.16A From broadcast to OTT — the unit of viewing moves from the schedule to the thumbnail, from the living room to the personal screen

Note The CRT living room — when the broadcast schedule set the length

Note OTT — from schedule to thumbnail. The unit of viewing has changed

Note The personal screen — viewing where the next episode plays automatically

G-24 Screens of different lengths — from bumper ads to feature films (GPT-generated image — for concept only)

A sentence to use on set

When shooting a long main film, plan in advance where the short versions will be cut from it. The 3-minute film must contain the 1 min · 15 s · 6 s versions so that one shoot can fill several media.

Exercise 7.16

Task	Plan 6-second bumper, 15-second, 1-minute and 3-minute versions for the same brand, and make a structure chart for each.
Tip	Cut the message as it gets shorter; add characters and story as it gets longer.
Assessment	Fit of structure to length, consistency across versions
Model answer	Before shooting, plan where the 6- and 15-second versions will be cut from the 3-minute film.

PART 07 Advertising production and case studies

7.17 Ads people watch to the end

Designing a 1-minute ad. The retention curve falls over time. Just before it drops, place a device that pulls viewers back, so every moment creates a fresh 'reason to see what's next.'

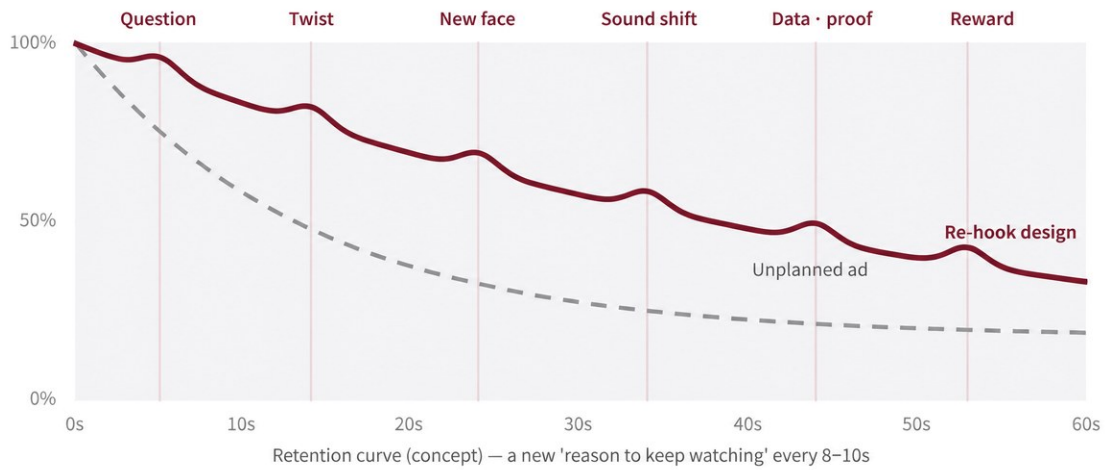

Figure 88 Re-hook design for a 1-minute ad — grab them again just before they drop

01 **Open question** In the first 3 seconds, pose a question and hold back the answer. Give it in the last 10 seconds.

02 **Pattern break** Every 8–10 seconds, change one of shot size, place, sound or speed. When the same rhythm runs past 20 seconds, drop-off rises.

03 **People and faces** Faces and reactions hold attention longer than products. Make viewers curious about the character's choice.

04 **Proof and numbers** Put a demo, numbers or a before-and-after in the middle to promise a payoff for watching to the end.

05 **Brand early and often** Show it once in the first 5 seconds, once naturally within the story, and once at the end.

TIP

Insert a new device 3 seconds before the steepest drop.

GEICO's "Unskippable" (2015) declared the ad over, then kept rolling as the family held still while the dog devoured the food on the table, turning the skip button itself into the story.

> Know the rules of a format, and the rules themselves become the idea.
>
> 7.17 Ads people watch to the end

Exercise
7.17

Task	Design at least 5 devices that keep viewers watching a 1-minute ad to the end, and mark them on a timeline.
Tip	Every 8–10 seconds, place a question, a twist, new information or a change in sound.
Assessment	Re-hook spacing, design of reasons to keep watching
Model answer	GEICO, "Unskippable" (2015). It turns the skip button itself into story material.

PART 07 Advertising production and case studies

7.18 Making the brand stick

Designing so both the effect and the brand stay with people. Viewers often remember an ad yet forget which brand it was for. The design must leave both 'what was good' and 'whose it was.'

Distinctive brand assets

Color

- One color, used long and consistently
- So the color alone recalls the brand, even without a logo

Sound

- A short sound logo, a recurring musical motif
- Reaches even people not looking at the screen

Shape and character

- Product silhouette, mascot, signature gesture
- Binds many ads into one memory

Words

- Slogans short and rhythmic
- Don't change it with each ad; build it up

Directing that makes the effect stick

ABCD
Google's principles for YouTube ads — attract, brand, connect, direct. A framework for checking short ads.

Prove it with one scene, not words

- Volvo Trucks, "The Epic Split" (2013)
- One shot of a split between two trucks proves the precision of the steering

Brand at the emotional peak

- The brand must be there at the moment of strongest emotion for the memory to bind

Check with ABCD

- Attract · Brand · Connect · Direct
- A simple checklist for short ads

A sentence to use on set

Cover the logo in the edit. If you can still tell which brand it is, the branding has stuck.

Exercise 7.18

Task	Define 5 distinctive assets (color, sound, shape, character, words) for a fictional brand and place them all in a 15-second ad.
Tip	As a rule, show the brand within the first 5 seconds and put the sound logo at the end.
Assessment	Consistency of the assets, clarity of the brand link
Model answer	Make an ad whose brand is recognizable even with the logo covered.

PART 07 Advertising production and case studies

7.19 Designing outdoor LED loops

Outdoor LED screens are seen without sound, by people walking or driving, from afar, over and over. They need a design entirely unlike cinema or phones.

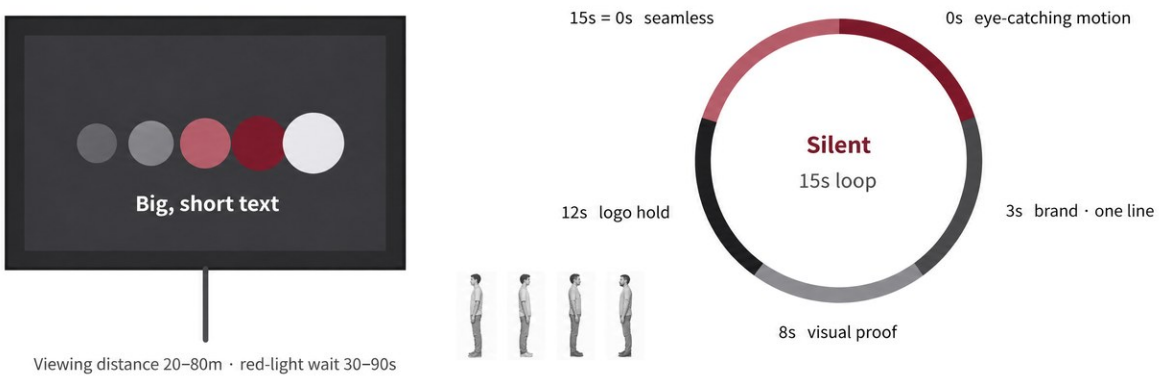

Figure 89 A 15-second outdoor LED loop — silent, distant, seamless repetition

Note Outdoor LED loop — seen by people walking, without sound, from afar, over and over

10–30 s	3 s	5–10 %	1–2 min
Loop unit — the end flows into the start	Time to read one line of text	Minimum text size relative to screen height	Longest time a viewer stays

Five checks

01
Does it work on mute?

The message must get across without sound. Text: one sentence, readable within 3 seconds.

02
Can it be seen from afar?

Text at least 5–10% of screen height, high contrast, simple shapes. Thin lines and small type vanish.

03
Is every moment a start?

Viewers join mid-loop. Show the brand every few seconds, and make the last frame lead into the first.

04
Does it use the screen's shape?

Corner screens: anamorphic illusion; vertical screens: up-down motion; giant screens: slow movement for scale (see 6.9).

05
Safety and regulations

Check local-government and media-operator playback standards so brightness and flicker don't distract drivers. Avoid sudden flashes and rapid blinking.

> **A sentence to use on set**
>
> Play the final cut on your phone at arm's length, sound off, for just 3 seconds. Whatever remains then is all that will remain on an outdoor screen.

Exercise
7.19

Task	Make a 15-second silent loop for an outdoor LED screen and test it at the size it appears from real street distance.
Tip	Make the first and last frames connect, and use only as much text as can be read in 3 seconds.
Assessment	Silent clarity, loop continuity, legibility at a distance
Model answer	Study viewing conditions, such as time spent waiting at traffic lights, to decide length and amount of information.

MEMO · PART 07

PART 08

What you make in this PART

1. A YouTube channel plan (description · banner · playlists · first 3 videos)
2. A one-month content calendar and a 2-week operating log
3. A production pipeline with AI tools placed at each stage, and a 1-minute video

Platform operations and generative AI

Making a good video and getting it discovered are different skills. Each platform rewards different behavior, and titles and thumbnails are already part of directing. This PART answers the question "How do I get more views?" with platform grammar, reading metrics, and the place of generative AI.

Photo P-09 A work desk with a vertical shooting rig and a performance dashboard · generated image

Using this chapter in class

Tell platform grammars apart and place AI in the pipeline

Materials Each student's own account or a mock account, access to a language model

Intro	Concept	Plates	Exercise	Wrap-up
Predict the CTR of two titles for the same video	What each platform rewards, the order for reading metrics	The 6-stage AI pipeline and the tool landscape	Generate 20 ideas, narrow to 3, record the reasons	Introduce the AI-use log form

> Check point
>
> Explains at which stage AI went in, and why

PART 08

Introduction

Making a good video and getting it discovered are different skills. Since YouTube removed the barriers to distribution, the starting point of planning has moved from the idea to discoverability. That is why titles and thumbnails have become part of directing.

Each platform has its own grammar. YouTube runs on search and watch time, Instagram on saves and shares, TikTok on participation and derivative works. Posting the same video unchanged and then remarking that results differ only shows you don't know what each platform rewards.

This part covers everything from writing titles to building hashtags, answering comments, interpreting performance metrics and the basics of running ads. Why does a maker need this? Because the role most in demand in today's job market is the person who makes, posts and reads the numbers.

Background 16

The attention economy and the algorithmic audience

In the platform era, video does not go straight to the audience; it arrives via recommendation algorithms. To understand views, you must first understand a scarce resource: attention. In a 1971 talk Herbert Simon said that 'a wealth of information creates a poverty of attention,' and in the late 1990s Michael Goldhaber and others called this situation the 'attention economy.' Today every video competes for a few seconds of people's time on the same screen.

Platforms leave the refereeing of this competition to algorithms. In 2012 YouTube announced it would shift its recommendation criteria from clicks to watch time, and since then many platforms have weighted behavioral signals such as retention, completion rate, rewatches and shares. The workings are not public and change often, but the principle is clear: videos that people watch to the end, watch again and send to others get shown to more people.

There are two lessons for makers. First, even if the thumbnail and title win the click, retention drops and recommendations shrink when the content breaks the promise. Exaggerated titles gain short-term clicks and lose long-term trust. Second, what matters is the loop of checking drop-off points, early and midway, in the data and applying what you learn to the next video. The metrics reading in chapter 9 is a tool for this loop.

There is a common structure too. The system first shows a video to a small group of users as a test, then widens or narrows its reach based on the response. The signals it reads are how long people watched and whether to the end, whether they saved or shared it, and whether they came back. Views are a result, not a cause. The variables a maker can work with are not views but retention and response rates.

There is one trap. The observation that a metric breaks down once it becomes a target is known as Goodhart's law. Sensational thumbnails and exaggerated titles raise short-term CTR but increase drop-off and erode trust in the whole channel. Metrics are a window onto the audience's response, not the audience itself.

In the algorithm era, the maker's responsibility grows too. Disinformation, violating other people's portrait rights, and passing off generative-AI images as real are not worth any number of short-term views. A good channel does not trick the algorithm; it

steadily gives value to a specific audience. In the end, the algorithm follows the behavior of the people who find that value.

Further reading — Tim Wu, The Attention Merchants · Michael Goldhaber, "The Attention Economy and the Net"

PART 08 Platform operations and generative AI

8.1 Platform map

Did the viewer come to see this video, or come for something else and run into it? This single judgment completely changes your first-3-second strategy.

Note A thumb flicking through the feed — for the 'viewer passing by,' the first 3 seconds are about stopping this thumb

Platform	Viewing mode	Attention	Sound	Job of the first 3 s
TV	Seated, passive	Low	On	Stop channel-flipping
Cinema	Immersed, captive	Very high	High quality	Enter the world
YouTube in-stream	Waiting for their video	Low, hostile	On	Prevent the skip
YouTube video	Via search or recommendation	High	On	Confirm expectations
Short-form	Scrolling, active	Very low	Mostly off	Stop the scroll
Instagram feed	Browsing	Low	Off	Catch the eye with the thumbnail
Outdoor media	On the move, by chance	Very low	None	Recognized by shape and color
Blog embed	Played mid-read	High	Optional	Tie-in with the text

TIP

Time how long you spend on each platform per day, and the map comes into focus.

Viewers who came to watch

- YouTube videos reached via search · recommendation, blog embeds
- Just meet their expectations
- The first 3 seconds confirm "I'm in the right place"

Viewers passing by

- In-stream, short-form, feed, outdoor
- You must create expectations
- The first 3 seconds stop the skip and the scroll

Exercise
8.1

Task	Place 5 platforms you use on a map by purpose (discovery, conversation, sales, archive).
Tip	Time how long you spend on each platform per day.
Assessment	Understanding of platform traits
Model answer	Design a flow in which one piece of content changes form as it moves across platforms.

PART 08 Platform operations and generative AI

8.2 Running YouTube

YouTube runs on search and watch time. The sequence: win the click with title · thumbnail, keep the promise with the content, and extend the session with the next video.

Writing titles

Note

Exaggerated clickbait wins early clicks but lowers retention, and in the end cuts impressions.

01 Put the key words within the first 25 characters. On mobile the end gets cut off.

02 Total length 40–60 characters. Past 100, most of it gets cut.

03 Numbers and concrete words beat abstract ones. "3 ways" rather than "good ways."

04 If you're after search traffic, use the exact phrases people actually type into the search bar.

05 Put the brand name at the end. Up front, it reads as an ad and CTR drops.

Designing thumbnails

Note Title and thumbnail A/B — the same video's CTR can vary severalfold with the thumbnail

Element	Standard	Common mistake
Text length	3–7 characters, 2 lines max	A whole sentence crammed in
Text size	At least 15% of screen height	Unreadable on mobile
Contrast	Strong value difference from the background	Lost in similar brightness
Face	Close-up with a clear expression	Full-body shot, tiny face
Color	2–3 fixed channel colors	New colors every time, no identity
Consistency	Same layout across a series	Doesn't look like the same channel

Descriptions, tags, chapters

- The first 2–3 lines of the description show in search results and previews. Put the key points and links here.
- Up to 3 hashtags from the top of the description appear above the title. Put the three most important first.
- Splitting chapters with timestamps makes videos easier to navigate and raises average view duration.
- A pinned comment with extra info or a question boosts comment engagement, and linking the next video through end screens and cards lengthens session watch time.

What the algorithm looks at

Metric	Meaning	How to improve
Click-through rate (CTR)	Clicks per impression	Redesign title and thumbnail
Average view duration	Time actually held	Analyze the cut before each drop-off
Retention rate	Share of length watched	Shorten, cut the mid-video lull

Metric	Meaning	How to improve
Session time	Time on platform after your video	Link related videos
Engagement	Likes, comments, shares, saves	Ask questions, design reasons to share
Return visits	Subscribers' rewatch rate	Keep a regular upload schedule

Analyzing drop-off points

Find the sharp drops on the retention graph and check the cut just before each. The cause is usually in that cut. For student projects, hold a small screening instead (about 10 people) and watch where attention falls away.

Exercise 8.2

Task Open a YouTube channel and plan its description, banner, playlists and first 3 videos.

Tip Define in one sentence whose problem the channel solves, and what that problem is.

Assessment Clarity of channel identity

Model answer Design playlists and end screens so the first 3 videos recommend one another.

PART 08 Platform operations and generative AI

8.3 The big 3 short-form platforms compared

The same 30-second vertical video reads differently on Shorts · Reels · TikTok. User habits, safe lengths and paths of spread all differ.

Note Challenge culture — the same track and the same moves spread at different speeds on each platform

Item	YouTube Shorts	Instagram Reels	TikTok
User habits	Tied to search and info consumption	Visual polish and taste	Trends and participation
Content type	Info and recap formats thrive	Aesthetic polish valued	Memes and challenges thrive
Editing tone	Caption-led explainers	Color and rhythm first	Fast transitions and sound
Use of music	Mostly background music	Sets the mood	Trending sounds drive spread
How ads land	Informative is accepted	Viewers leave if it looks like an ad	Own up to the ad, win on fun
Safe length	20–60 s	15–30 s	9–21 s
Path of spread	Recommended feed and search	Explore tab and shares	For You feed
Derivative works	Remix, Shorts remix	Remix, templates	Duet, Stitch, remix

Principles of vertical framing

12%
Top covered by UI

20%
Bottom covered by UI

1/3 lower
Captions centered, at the lower 1/3 of the screen

TIP

Cross-platform comparisons only hold if upload times and hashtags are matched.

- Place the subject on the frame's central vertical axis.
- Greatly raise the share of close-ups. In long shots, information turns to mush.
- Assume loop playback and make the first and last frames connect.

Exercise
8.3

Task	Post the same 30-second video to Shorts, Reels and TikTok and compare metrics for a week.
Tip	Match upload times and hashtags.
Assessment	Control of comparison conditions, interpretation of metrics
Model answer	Form hypotheses about what differed by platform and test them in the next upload.

PART 08 Platform operations and generative AI

8.4 Running Instagram

Instagram runs on saves and shares. The first frame is the thumbnail, and the first line of the caption is all that shows before "more."

Note Designing the feed grid — not one post but all nine tiles must read as one world

Format	Recommended spec	Traits	Production rule
Feed	4:5 or 1:1	Stops the scroll	First frame is the thumbnail
Reels	9:16	Spreads via Explore tab	Start and end built to loop
Stories	9:16	Gone in 24 hours, full screen	Add elements that invite taps
Carousel	4:5	High save rate	1 point per slide
Live	9:16	Real-time interaction	Fixed lighting, steady sound

Captions and hashtags

Hashtag size

Think of large tags as hundreds of thousands of posts or more, medium as tens of thousands, small as thousands.

First line

Lead with the conclusion

- All that shows before "more"
- Ending on a question brings more comments

Hashtags

10–15, mixing large · medium · small

- Only large tags and you're buried; only small ones and reach is low
- Put one brand-specific hashtag on every post as an archive

Tags

Location · account tags

- Genuinely add to reach

Managing comments and community

— Reactions in the first hour after posting affect later reach. Reply to comments during that hour.

— Answering negative comments publicly beats deleting them. Obvious abuse and spam are the exception.

— Saves and shares weigh more with the algorithm than likes. Include information worth saving.

Exercise 8.4

Task	Plan the 9-tile grid of an Instagram account in a single look and feel.
Tip	Build a rhythm in sets of 3 posts (photo, video, text).
Assessment	Visual consistency, operating plan
Model answer	The whole grid reads as one brand world.

PART 08 Platform operations and generative AI

8.5 TikTok and remix culture

TikTok is not about showing finished content but about leaving room to join in. Duet, Stitch and remix are devices that let others use your video as material, and they are the main path of spread.

Feature	How it works	How to plan for it
Duet	Someone else's video plays side by side with yours	Leave moments others can react to
Stitch	Others clip part of your video to open their own	End on a question or an unfinished sentence
Remix	The original is edited into a new video	A simple structure that's easy to edit
Trending sounds	Videos using the same sound are grouped	Get in early on rising sounds
Challenges	People copy the same move or format	A simple move anyone can copy within 3 seconds

TIP

Keep the original format's rules and twist just one element.

Principles of designing for participation

Spread comes from leaving room that makes people want to copy, rebut or add on. The same applies to ads.

> Make it perfect, and no one will touch it.
>
> 8.5 TikTok and remix culture

Exercise 8.5

Task	Pick a trending format and make a TikTok video that gives it your own twist.
Tip	Keep the original format's rules and twist just one element.
Assessment	Grasp of the format, originality of the twist
Model answer	Join in ways that respect the original creator (duets, credit).

PART 08 Platform operations and generative AI

8.6 Threads and text-based media

Short text is the star; images and video play support. The sentence itself does the hooking.

Note Text-based media — the sentence itself is the hook. The video follows

Threads

Lines that open a conversation

- Short autoplay videos do well
- Lines that invite conversation are favored by the algorithm

X (formerly Twitter)

Breaking news and memes

- Links spread fast
- Video under 30 s, captions a must

LinkedIn

Work and careers

- Centered on job-related information
- Directly useful for showing portfolios and job hunting

TIP

Ask a question in the first sentence and put the video link last.

Even a post promoting one video follows the medium's grammar. Threads rewards conversation, X rewards speed, LinkedIn rewards professional context.

Exercise 8.6

Task	Write 5 text posts promoting one video, Threads-style.
Tip	Ask a question in the first sentence and put the video link last.
Assessment	Pull of the writing, sparking conversation
Model answer	Turn questions from the comments into topics for the next video.

PART 08 Platform operations and generative AI

8.7 Blog platforms compared

A blog captures search traffic and time on page at once. Post only video and visits are short; write only text and there is nothing to show.

Platform	Strengths	Weaknesses	Video use	Best for
Naver Blog	Top search traffic in Korea	Limited visibility in other search engines	Native player or YouTube embed	Korean info posts, local topics
Tistory	Free customization, Google visibility	Slow early traffic	Mainly YouTube embeds	Long-form archive, AdSense
Brunch	Exposure based on writing quality	Approval needed, limits on commercial use	Video embeds possible	Essays, branding
WordPress	Total freedom, extensibility	You run it all yourself	Embed anything	Portfolio site
Medium	Global readers, clean layout	Little Korean traffic	Mostly embeds	English articles, global reach
Public Notion page	Quick to make, free	Weak SEO	Embeds	Quick portfolio

TIP

Moving the video script into the body text greatly boosts search traffic. Cleaning up the auto-captions is a quick way to do it.

Putting video on a blog

- Place summary text above and below the video to secure both search visibility and time on page.
- Work search terms naturally into the title and first paragraph. Forced repetition actually gets penalized.
- Add alt text to images. It helps both accessibility and search.
- For a portfolio, write up the production process, the problem-solving and the result, in that order. A post with only results doesn't stand out.

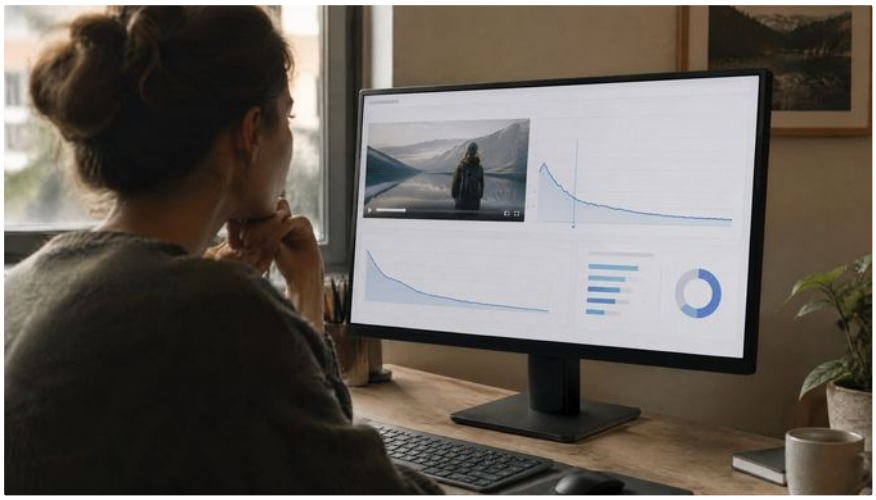
Exercise 8.7

Task	Post the same making-of write-up on two blogs and compare the search traffic.
Tip	Put search terms in the title and describe your images in the body.
Assessment	Understanding of SEO
Model answer	Analyze a month of incoming search terms to plan the next post.

PART 08 Platform operations and generative AI

8.8 Key performance indicators

Read metrics in order. Reach, CTR, retention, engagement. Checking them in sequence narrows down the cause quickly.



Note Retention curve — the cause lies in the cut just before the plunge

The order for reading metrics

01 Reach
If low, a posting-strategy problem

02 CTR
If low, a title-and-thumbnail problem

03 Retention
If low, a content problem

04 Engagement
If low, a relationship problem

TIP

Find the steep drops on the retention graph and rewatch those scenes.

Metric	Meaning	Formula or source	How to improve
Reach	How many people saw it	Platform insights	Posting time, hashtags
Click-through rate	Clicks per impression	Clicks ÷ impressions	Title and thumbnail
View-through rate (VTR)	Views per impression	Views ÷ impressions	Redesign the first 3 s
Completion rate	Share who watched to the end	Completions ÷ views	Shorten it
Average watch time	Time actually held	Total watch time ÷ views	Analyze drop-off points
Engagement rate	Likes, comments, shares, saves	Engagements ÷ reach	Design reasons to share
Follower growth rate	Net gain per post	Gain ÷ reach	Sharpen channel identity
Save rate	Saves relative to reach	Saves ÷ reach	Raise information density
Cost per view	Ad efficiency	Cost ÷ views	Targeting, swapping creatives
Brand lift	Change in awareness and liking	Before-and-after surveys	Message clarity

Exercise
8.8

Task	Tabulate views, average view duration and CTR for 3 of your videos, and find what to improve.
Tip	Find the steep drops on the retention graph and rewatch those scenes.
Assessment	Accuracy of metric interpretation, causal hypotheses
Model answer	Upload a new version with the drop-off points fixed and check the change.

Background 17

What generative AI changes

Before comparing tools, we first map where this technology enters the production process. Generative AI for video has grown along three branches: models that make images from text, video models that make motion from images and text, and audio models that make voices and music. Their roots differ, but they work in similar ways. They learn patterns from vast amounts of data, then produce results that fit the given conditions probabilistically. That is why the same prompt gives a different result every time.

In practice this probabilistic nature shows up in two ways: drafts come very fast, and the same result is hard to get twice. So in the field, AI serves less as the maker of final output than as a tool for early exploration. It suits stages where you need to see many options fast: rough storyboard images, concept art, layout drafts, caption drafts, alternative copy.

Consistency is the biggest challenge. The same character's face shifts slightly from scene to scene, and the lighting in the same space changes from cut to cut. Fixes include feeding in reference images, making a key image first and generating the rest to match it, and correcting in post-production. Decide in advance 'how far AI goes and where people take over,' or the schedule will fall apart.

In the end, the yardstick is problem-solving. AI quickly produces results that are plausible on average, but it cannot answer why this brand must say this message now, or what the audience should feel in this scene. Judgments of planning, structure and taste still belong to people. The cheaper the tools get, the more the difference lies in the questions of the person using them.

Ethical and legal questions follow too. The source of training data, imitating a particular artist's style,

and synthesizing a real person's face or voice all need careful handling. On a commercial project, check the terms of use for whether commercial use is allowed and who owns the rights, and tell the client in advance how far AI will be used. When you use a person's face or voice, always get that person's consent.

In short, this technology does not remove a stage of production; it sharply lowers the cost of a first draft at every stage. What grows is not slack but options. The skilled people of this era are those who know what to choose from a bigger pile of drafts.

PART 08 Platform operations and generative AI

8.9 Comparing generative AI tools

How the tools compare and how to use them. Each area's tools sit in a different place in practice. Know where to use them and what to watch for, and your judgment holds even when the tool names change.

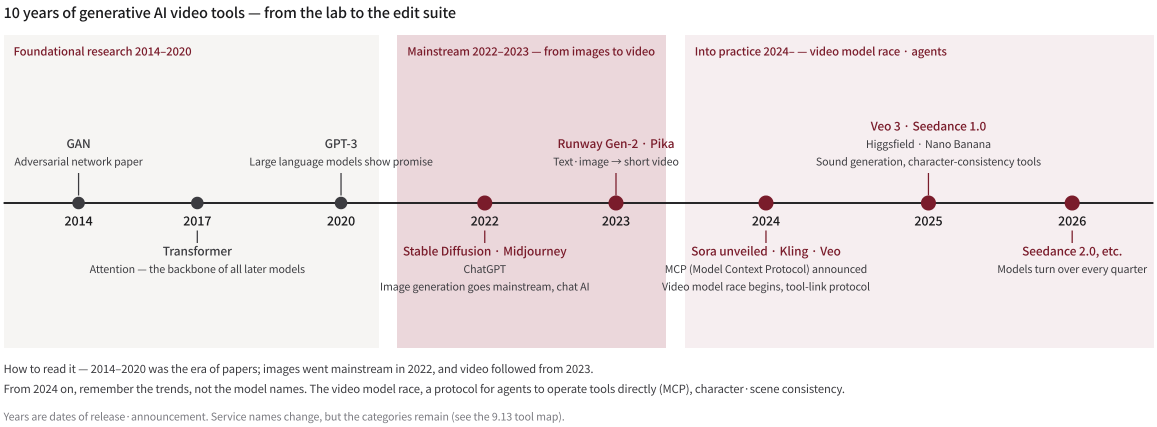

Figure 90 10 years of generative AI video tools — from GAN (2014) through the Transformer (2017), mainstream image generation (2022), and the video model race and MCP (2024), to the generational turnover of 2026

Current trends

Trend 1

The video model race

- Veo · Sora · Kling · Seedance · Runway: a new generation every quarter
- Compared on length, sound and physics accuracy
- Rather than picking a tool, build a pipeline where tools can be swapped

Trend 2

Agents and MCP

- A connection protocol that lets language models like Claude operate generation tools directly
- The model calls the tools; no one copies and pastes prompts
- This book's reference photos were made that way — one flow from planning document to generation

Trend 3

Consistency tools

- Features that keep characters and scenes consistent across cuts
- Multi-image references — lock face, costume and space with several images
- The biggest problem in Background 17 is becoming a product feature

Note Linking tools — MCP. A language model calls generation tools, storage and calendars directly

Area	Tool type	Role in practice	Watch for
Planning, writing	Chat language models	Expanding ideas, script drafts, copy variations	Fact-check; a person makes the final call
Image	Image generation models	Mood boards, concept art, storyboard drafts	Check commercial-use terms
Video	Text- or image-to-video generation	Inserts, backgrounds, impossible shots	Consistency is the challenge
Voice	Speech synthesis	Scratch narration, multilingual dubbing	Never clone a real person's voice
Subtitles, rough cut	Speech-recognition editing tools	1st rough cut, subtitle generation	Always check proper nouns for errors
3D	Image-to-3D generation	Props, character prototypes	Polygon cleanup needed
Translation	Machine translation	Foreign subtitles, reading foreign references	Check for mistranslated jargon

Good and bad uses of language models

Effective uses

- Expanding ideas — set conditions, get 20, narrow to 3
- Script draft — set the structure first, then ask for the flesh
- Copy variations — ask for 10 versions of one approved line
- Organizing research — paste in what you gathered and ask for structure
- Feedback — paste in your proposal and ask for its weak points
- Translation — supply context and a glossary

What not to do

- Taking the first answer as is
- Asking it to write everything from a blank page
- Handing over the concept itself
- Quoting without fact-checking
- Stopping at praise
- Using jargon unchecked

Sample AI tool workflow

Note

A person writes the one-sentence concept. This step is never delegated.

01 Use a language model to generate a target persona and 20 pain points, then narrow them to 3 yourself.

02 From the narrowed ideas, a person writes the one-sentence concept.

03 Make mood boards and storyboard drafts with an image generator. Agreeing on tone and manner gets much faster.

04 Generate only the inserts you cannot shoot live. Fill the whole piece with generated footage and consistency collapses.

05 Make a draft narration with speech synthesis to test length and rhythm. For the final, replace it with a voice actor or your own recording.

06 Make 1st-pass subtitles automatically, then have a person check proper nouns and spelling.

07 Log AI use in the production documents. Contests and client deliveries increasingly require disclosure.

What AI cannot replace

The judgment to decide what to shoot, the language to explain why it has to be that cut, the coordination to reach agreement with the client, the decisions that handle surprises on set. The more powerful the tools, the more judgment is worth. Entry-level hiring has begun to value explaining your reasoning over tool skills.

Exercise 8.9

Task	Make the same cut with 3 generative AI tools and compare quality, speed, cost and rights terms.
Tip	Check the commercial-use clause in the terms of service.
Assessment	Fair comparison criteria, rights checked
Model answer	Publishes the prompts and settings with the results so they can be reproduced.

PART 08 Platform operations and generative AI

8.10 Running a channel and the content calendar

Ten steady videos build a channel better than one good one. Running a channel is a different skill from making videos, and it is the experience entry-level hiring actually rates highest.

Designing a channel in 5 steps

01 One-sentence definition
What the channel gives, and to whom

02 2–3 fixed formats
Give viewers something to expect

03 Upload schedule
Keeping to 1 a week beats doing 3 a week and then stopping

04 Fixed visual rules
Thumbnail layout, caption font, intro or not

05 One performance metric
Not subscribers, but something you can improve, like average view duration

Sample monthly content calendar

Week	Content type	Purpose	Difficulty	Reuse
Week 1	1 informational long-form video	Search traffic	High	Split into 3 short-form clips
Week 2	3 short-form clips	New reach	Low	Post to Instagram and TikTok at once
Week 3	Interview or collab	Trust and growth	Medium	Turn into a blog post
Week 4	Community content	Keeping relationships	Very low	Ideas for next month

One idea, many media

One source, multi-use

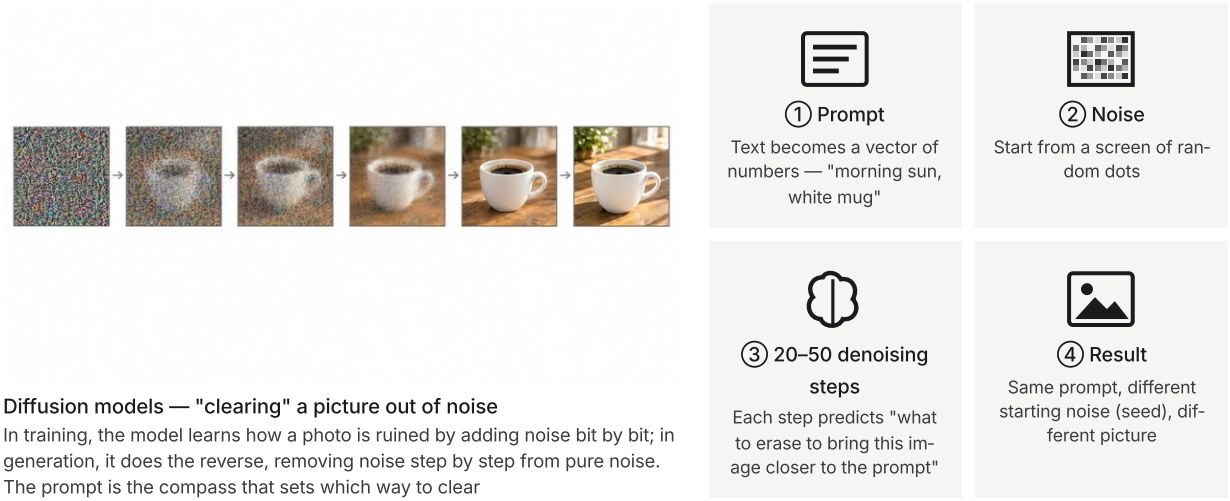
Source	Derivative	Workload	Payoff
10-min long-form	3 short-form clips	Low	New viewers

Remaking the same message in each medium's grammar. It is the surest way to get more reach for the production budget.

Source	Derivative	Workload	Payoff
10-min long-form	1 blog post	Low	Search traffic
10-min long-form	1 carousel set	Low	Instagram saves
10-min long-form	1 newsletter issue	Very low	Direct connection
Raw footage	Behind-the-scenes short	Very low	Closeness

> Reuse is not laziness but strategy.
>
> 8.10 Running a channel and the content calendar

Generative AI doesn't draw; it clears away noise



Diffusion models — "clearing" a picture out of noise
In training, the model learns how a photo is ruined by adding noise bit by bit; in generation, it does the reverse, removing noise step by step from pure noise. The prompt is the compass that sets which way to clear

Figure 90 How generative AI works — the diffusion model. Video generation models extend the same principle along the time axis. That is why they are better at "this kind of mood" than "exactly this scene," and get details like the number of fingers wrong.

Exercise 8.10

Task Make a one-month content calendar and actually run it for 2 weeks.

Tip Choose a pace you can keep, such as 2 posts a week.

Assessment Execution against plan, retrospective

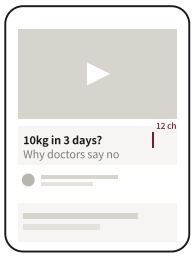
Model answer Keeps a record of revising the calendar based on metrics during the run.

PART 08 Platform operations and generative AI

8.11 Writing titles and hooks

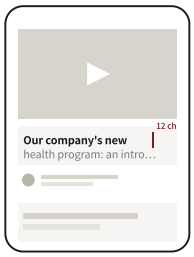
The same video can get several times the views depending on its title. Copy is a separate skill, and one every video maker must learn.

The first 12 characters decide the title — what a phone screen shows



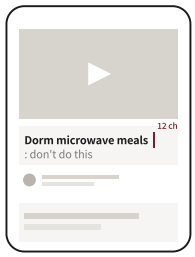
○ Number + question — key point in the first 12

10kg in 3 days? Why doctors say no



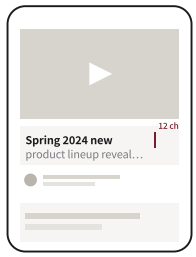
× Only the subject in the first 12 — key point later

Our company's new health program: an introduction video



○ Audience + don't — decided in line one

Dorm microwave meals: don't do this



× Date · reveal · share — words with no information

Spring 2024 new product lineup reveal and user review sharing

Five hook formulas — in real titles

Number	Color grading done in 30 seconds	Question	Why my videos get no views	Don't	Lenses beginners should never buy
Before-after	The difference a ₩50,000 light makes	Secret	The cut order ad PDs won't tell you		

Figure 91 The first 12 characters decide the title — the number of characters a mobile feed shows. The red line marks the 12-character limit; with no keyword before it, the rest goes unread. Choose just one of the five formulas.

12 title types

Type	Structure	Example
Number	N things + audience	5 things video beginners must know
Result first	Result + method	The editing that got 10× the views
Contrarian	Defy the common belief	Why you don't need an expensive camera
Question	Spark curiosity	Why my videos get swiped away at 3 seconds
Name the audience	Say who it is for	Shooting basics for 1st-year students
Comparison	A vs. B	Premiere or Final Cut: which to learn
Time limit	State a time frame	A 15-second ad made in one week
Failure story	Share experience	7 ways my first shoot went wrong
Name the tool	A specific tool	An ad shot with just a smartphone
Before and after	Stress the change	The difference one light makes
Secret	Scarce information	Shooting notation used only on set
Checklist	Practicality	What to check the day before a shoot

Rules for writing hooks

01 Put the most important word first. On mobile, the end gets cut off.

02 Concrete words beat abstract ones: "in 3 seconds," not "a good way."

03 Naming the audience raises click-through. A title aimed at everyone reaches no one.

TIP

In short-form, the first caption does a title's job. Keep it short enough to read in 0.5 seconds.

04 Overblown clickbait wins early clicks but lowers retention, and in the end impressions drop.

05 Put the brand name last. Up front, it reads as an ad.

Writing descriptions and captions

Platform	First line	Length	Wrap-up
YouTube description	Video summary and key links	2–3 lines + details	Chapters and related videos
Instagram caption	Conclusion or question	1–3 lines	Invite comments with a question
TikTok caption	Short hook	1 line	3–5 hashtags
Threads	A conversation opener	2–4 lines	Ask for opinions
Blog	Summary with search terms	3–5 lines	Link to the next post

Exercise 8.11

Task Make 5 titles and 5 thumbnails for the same video and ask 20 friends which they would click.

Tip Write each title in one mode: curiosity, benefit, number or contrast. Exaggeration and clickbait cost you trust.

Assessment Clarity of copy, use of test results

Model answer Goes on to check whether the most-clicked combination matches the actual content.

PART 08 Platform operations and generative AI

8.12 Basics of running SNS ads

Putting money behind a finished video to push it out has become part of the maker's job too. Without knowing how it works, even good creative won't perform.

Note Live commerce — broadcast and store have become one screen. Makers create the ad and run it as well

How SNS became a store

01	02	03	04
Open marketplaces	**Social commerce**	**Shopping tags · live commerce**	**Short-form commerce · automated ads**
Product lists and search. Video supports the detail page	Group buys and deals. Products start appearing in timelines	Buy straight from a post or during a stream. Video becomes the store	Product links inside videos. Machine-learning bidding and automated creative combine the assets

Reference photos 8.12A Operations and automation

Note Running an online store — a single video leads to the order screen

Note Ad automation — machines handle bids and combinations; people handle creative and message

How an ad account is structured

Level	What it sets	Where the maker comes in
Campaign	Objective (awareness, traffic, conversion)	Creative length and structure that fit the objective

Level	What it sets	Where the maker comes in
Ad set	Audience, budget, placement, duration	Aspect-ratio versions for each placement
Ad	The actual creative, copy, link	Thumbnail, first 3 seconds, copy

Rules for managing creative

TIP

Test by changing one variable at a time: two versions that differ only in the first 3 seconds, two that differ only in captions.

- Run 3–5 creatives in a campaign at once and compare results. With only one, there is nothing to compare.
- Even strong creative wears out after 2–3 weeks as fatigue builds. Plan the rotation in advance.
- Prepare vertical and square versions together. Each placement has a different ideal aspect ratio.
- The first frame is the thumbnail. The message must read even as a still.

Metrics in order of priority

01

Impressions

Audience too narrow or bid too low — widen the audience, adjust the budget

02

View rate or click-through rate

A first-3-seconds or thumbnail problem — redesign the hook

03

Retention

A dull middle — shorten it, adjust the cutting rhythm

04

Conversion or engagement

Message and landing page don't match — check the copy and the linked page

Meet the disclosure duty

Sponsorships and ads must always be clearly labeled. Put a phrase such as "Includes paid promotion" in the first line of the text or early on screen. A missing label is a legal risk for brand and maker alike.

How big creator advertising has grown, and what became mandatory

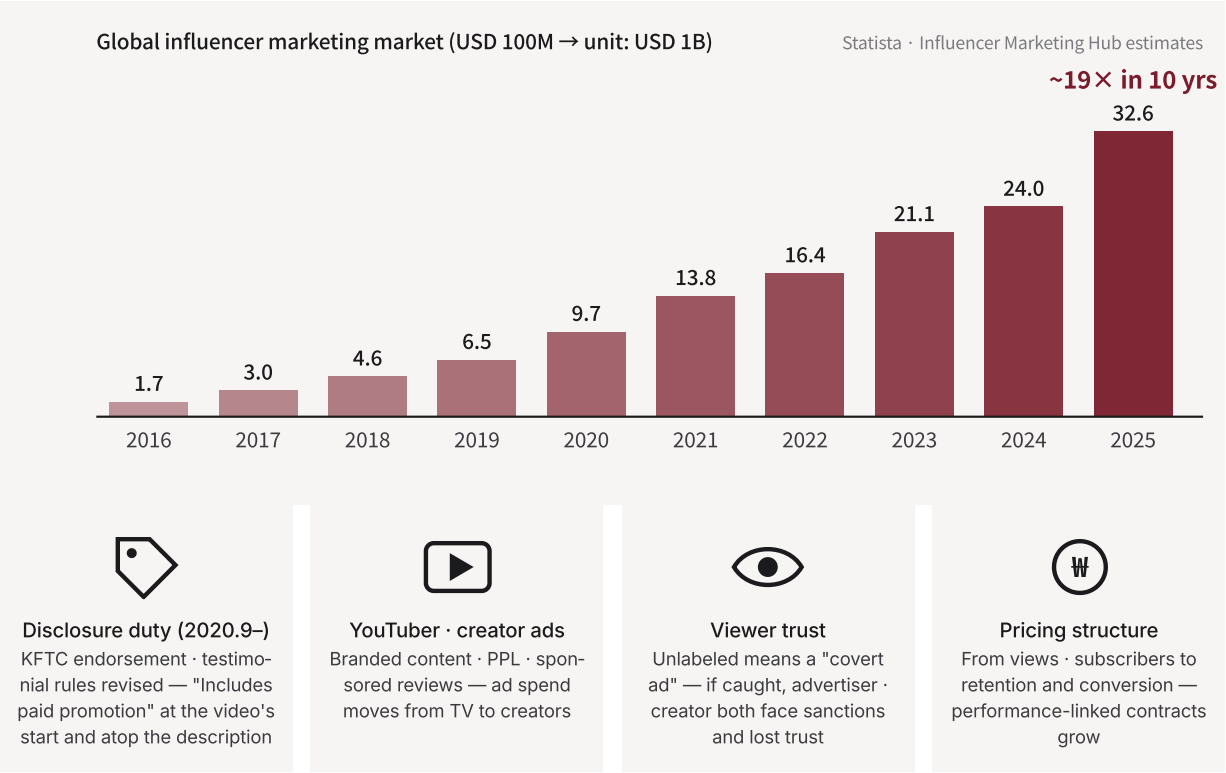


Figure 92 The growth of creator advertising and the duty to disclose — in 10 years the market grew about 19-fold, and the rules of disclosure and trust grew stricter to match. Figures are estimates that vary by source.

Exercise 8.12

Task	Write an SNS ad plan on a small (or imaginary) budget (goal, audience, creative, budget, metrics).
Tip	Prepare at least 2 creatives and design a comparison test.
Assessment	Goals matched to metrics, budget allocation
Model answer	Follows through with a results report after the run.

PART 08 Platform operations and generative AI

8.13 Designing an AI production pipeline

What separates those who use generative tools from those who don't is not speed but structure. Hand the whole process to AI and consistency collapses; use none and you lose on volume. The key is designing what to slot in at which point in the pipeline.

Note — AI production pipeline — the director is the one who knows which of dozens of drafts to pick

AI doesn't replace the whole process; it slots in at three points

Planning	Visualization	Shoot / generate	Voice	Editing	Review
Language model	Image generation	Video generation	Speech synthesis	Auto subtitles · rough cut	Human
20 ideas → narrowed to 3	Mood board · storyboard drafts	Stands in for unshootable inserts	Draft narration · multilingual	1st cut and draft subtitles	Final call on facts · rights · quality

AI doesn't replace the whole process; it slots in at **three points** — expanding ideas · visualizing drafts · automating post-production. Judgment and agreement remain human work.

Figure 93 — The AI production pipeline — AI enters five of the six stages, and a person does the final review.

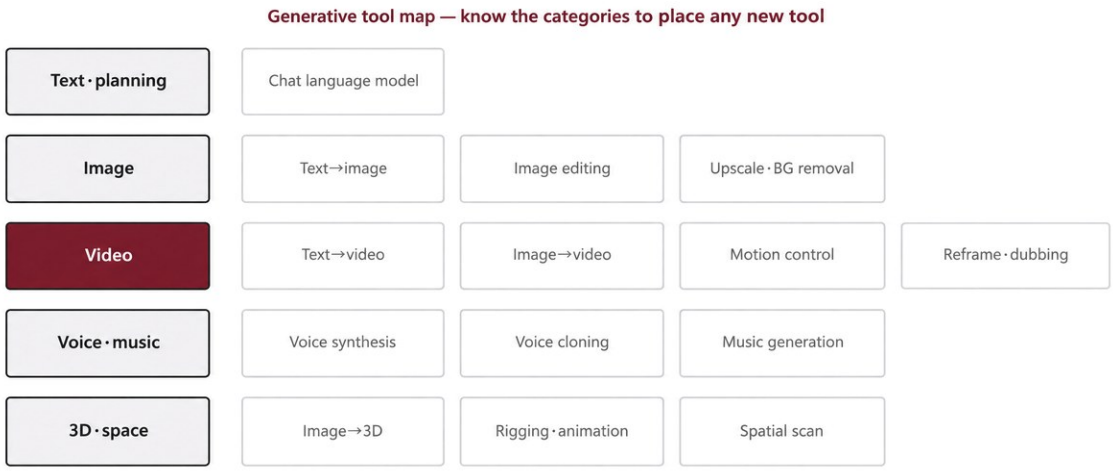

Figure 94 Map of generative tools

Tool map

Note

Tools keep changing. Remember categories and limits, not service names.

Category	Typical tools	Use in practice	Limits
Language models	ChatGPT, Gemini, Claude	Expanding ideas, script drafts, copy variations, organizing research	Needs fact-checking; can't make the final call
Image generation	GPT Image, Nano Banana, Midjourney, Seedream	Mood boards, concept art, storyboard drafts, background plates	Unreliable text rendering, hard to keep consistent
Video generation	Sora, Veo, Kling, Seedance, Runway, Higgsfield	Inserts, backgrounds, unshootable scenes, previs	Length limits, character consistency, physics errors
Speech synthesis	ElevenLabs, Typecast, Seed Audio	Scratch narration, multilingual dubbing, testing drafts	Never clone a real person's voice
Music generation	Suno, Udio	Temp music for drafts, exploring mood	Commercial-use terms must be checked
Editing aids	Vrew, CapCut, Premiere AI features	Auto subtitles, silence removal, 1st rough cut	Proper-noun errors, no feel for pacing
3D generation	Meshy, Tripo	Props, character prototypes	Polygon cleanup needed

Making a 15-second ad with AI, step by step

01
Diverge
Feed the brief to a language model; get 20 pain points and 10 concept candidates

02
Converge
A person narrows them to 3 and writes the one-sentence concept. That sentence alone is never delegated

03
Visualize
Mood board and 6-cut storyboard drafts by image generation. This is where agreeing on tone and manner speeds up most

04
Previs
Feed the storyboard to video generation for an animatic. Catch rhythm problems before the shoot

05
Assign cuts
Split live-action and generated cuts. Any cut where a face is clearly seen is safer shot live

06
Unify
In post, match generated cuts to the live cuts' color temperature and grain. Skip this and it shows at once

07
Draft narration
Test length and rhythm with speech synthesis. For the final, replace with a voice actor or your own recording

08
Temp music
Set the edit rhythm with generated music, but swap in clearly licensed tracks for delivery

09
Check subtitles
Auto-generate a 1st pass; a person checks proper nouns and spelling

10
Log use
Record AI use in the production documents. Contests and deliveries increasingly require disclosure

Three rules for mixing generated cuts with live action

Faces off-limits
Not for cuts where a face is large in frame

1/3 max
Keep generated cuts to 1/3 of a piece or less

Lens +grain
Lay the live cuts' lens distortion and grain over the generated cuts

Five rules for writing prompts

- Write in this order: subject, action, place, time, lighting, lens, mood. The more specific, like a shooting brief, the more stable the result.
- Positive phrasing works better than negative. Write "an empty street," not "no people."
- Use camera terms. Most models have learned words like wide-angle, telephoto, low angle and shallow depth of field.
- Don't ask for text in the image. Adding lettering yourself in the edit is always more accurate.
- Running the same prompt several times and choosing is faster than struggling to write the perfect prompt in one go.

Exercise
8.13

Task	Design a production pipeline that places AI tools at each stage from planning to editing, and finish a 1-minute video.
Tip	Mark the points where a person must decide.
Assessment	Pipeline efficiency, quality control, disclosure of use
Model answer	Openly states which parts AI made and which parts people made.

PART 08 Platform operations and generative AI

8.14 The corporate landscape and where the market is heading

The generative tool landscape shifts fast, but the companies in it fall into a few types. Know which company is after what, and choosing tools and setting learning priorities gets easier.

Type	Key companies	Position in video	What it means for makers
Foundation models	OpenAI, Google, Anthropic	Supply base models for language and video generation	Productivity in planning and documents
Platforms	Google (YouTube), Meta, ByteDance	Control distribution and recommendation algorithms	Discoverability, more than production, decides results
Devices	Apple, Google, Meta	Spatial computing and capture devices	New screen formats emerge
Video generation specialists	Runway, Higgsfield, Kling, Seedance	Plug directly into production workflows	Adopted at once as working tools
Audio	ElevenLabs, Suno	Voice and music generation	Draft costs plummet
Software	Adobe, Blackmagic	AI built into existing editing tools	No new tools to learn

TIP

Understand the categories rather than memorizing service names, and when a new service appears you can tell at once which slot it belongs in.

Platforms

Whoever holds the algorithm decides results

- Production skill alone won't deliver results
- Why title · thumbnail · posting strategy became part of directing

Devices

New screen formats create new forms

- Just as vertical screens created short-form
- Spatial displays will create yet another form

Software

Built-in AI favors newcomers

- Auto subtitles and background removal with no extra tools
- Ready to use as standard features

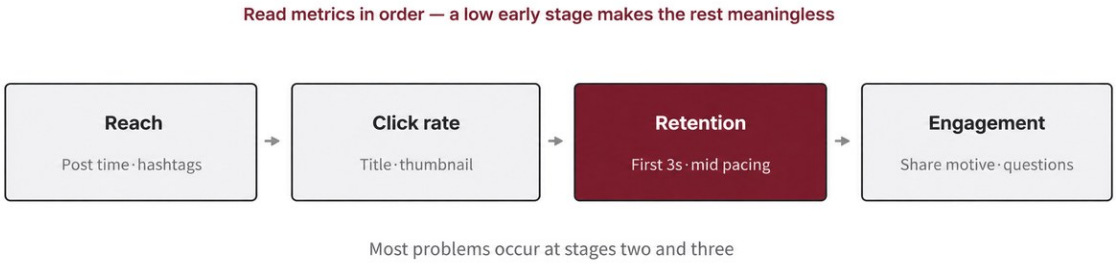

Figure 95 The order for reading performance metrics

Exercise
8.14

Task	Research one video company that interests you and summarize its business model and recent direction on 1 page.
Tip	Check official announcements and article dates.
Assessment	Accuracy of information, analytical perspective
Model answer	Goes on to say what portfolio it would take to apply to that company.

PART 07–08 wrap-up

Exercises and review

01 **Classify hook types**

Capture the first 3 seconds of 3 ads you like and classify their hook types.

02 **5 titles, 3 thumbnails**

Make them for one of your videos and ask ten people which they would click.

03 **Captions by platform**

From the same material, write captions and hashtags in three versions: YouTube Shorts, Instagram Reels and TikTok.

04 **Script to blog**

Turn the script of one of your videos into a blog post and place three search terms in it.

05 **From 20 ideas to 3**

Get 20 ideas from a language model, narrow them to 3, and document the process.

06 **Mix in a generated cut**

Put 1 generated cut between live-action cuts and match its color and grain.

One-page summary

PART 07 The first 3 seconds of an ad	Tell apart the six types of 3-second hook, and be able to explain which type a favorite ad's first 3 seconds use.
8.1 Platform map	Whether viewers came to watch or ran into it while watching something else decides the first-3-second strategy.
8.2 Running YouTube	Keywords in the title's first 25 characters; thumbnail text 3–7 characters, at least 15% of screen height.
8.3 The big 3 short-form platforms	Shorts 20–60 s, Reels 15–30 s, TikTok 9–21 s. The top 12% and bottom 20% are hidden by the UI.
8.4 Running Instagram	10–15 hashtags, mixing large · medium · small. Reply to comments in the first hour after posting.
8.5 TikTok and remixing	Make it perfect and no one will touch it. Room to imitate is what makes it spread.
8.7 Blog platforms	Put summary text above and below the video and move the script into the body, and search traffic rises.
8.8 Key performance indicators	Read the metrics in order: reach, click-through rate, retention, engagement.
8.9 Generative AI tools	Limit AI to three points: expanding ideas, visualizing drafts, automating post. Never delegate the one-sentence concept.

8.10 Running a channel	One-sentence definition, fixed formats, upload schedule, visual rules, one metric. Reuse one idea across many media.
8.12 SNS ads	Run 3–5 creatives at once, compare one variable at a time, and always label sponsorships · ads.
8.13 AI pipeline	Keep generated cuts off faces and to 1/3 or less, and lay live action's lens distortion and grain over them. Log AI use.

Self-check

- Can you explain the six types of 3-second hook?
- Do you know how impressions click-through rate differs from retention?
- Can you explain why to mix large, medium and small hashtags?
- Can you plan with Duet and Stitch in mind?
- Can you judge which stage to bring AI tools into?

> **Field tips**
>
> Response in the first hour after posting drives later reach, so post at a time when you can answer comments. Always have a person check proper nouns in auto subtitles. One misspelled company name wrecks trust in an instant. Log AI use in the production documents. More and more commissions come with a disclosure duty.

Questions to consider

Q Can I define my channel in one sentence? Is the reason to subscribe in that sentence?

It is the first of the 5 channel-design steps in 8.10. If you can't say what the channel gives, and to whom, there is no reason to subscribe.

Q What part of my work can AI not do for me?

The judgment to decide what to shoot, the language to explain why it has to be that cut, coordination with the client, handling surprises on set. The more powerful the tools, the more judgment is worth.

PART

09

What you make in this PART

1. A value-chain map of the video industry
2. An 8-item quote and a simple contract
3. A 5-year path for the job you want

Industry and market trends

Video makes a fine hobby, but most readers of this book want to work in it. Knowing where the money flows, who gives work to whom, and which jobs are growing or shrinking is part of the skill. This PART answers the question "Where does the value of video come from?" with the market's structure and numbers.

Photo P-10 A full crew at work on a sound stage · generative image

Using this chapter in class

Understand the market's structure and the basics of quotes and contracts

Materials 10 job postings, a quote template

10 min	15 min	10 min	10 min	5 min
Intro	Concepts	Plates	Exercise	Wrap-up
Pick out the skills that recur in recent job postings	Industry structure, trends at home and abroad, 7 contract clauses	Walk through the job map and career paths	Write a quote for a mock freelance job	Why the portfolio-use clause matters

> Check point
>
> Does the quote state the number of revisions and the scope of use?

PART 09

Introduction

Video makes a fine hobby, but most readers of this book want to work in it. Then you need to understand the market's structure first. Knowing where the money flows, who gives work to whom, and which jobs are growing and which are shrinking is part of the skill.

The change to watch is that the center of gravity of video jobs has moved from broadcasting and film to digital, commerce and in-house corporate teams. Broadcasters' open recruitment was once the only gateway; now brand content teams, e-commerce companies' video staff and small studios hire far more newcomers. This shift has changed what goes into a portfolio, too.

Meanwhile, generative AI is driving down the rates for simple editing and simple graphics. The way to survive is not learning tools faster but moving up into judgment. Deciding what to shoot, explaining why this cut, and reaching agreement with the client are still human work.

Background 18

Where the value of video comes from

Many people and companies are involved before a video reaches its audience. Know where in that chain value is created, and you will see where you can stand. The traditional film industry was divided into development and financing, production, distribution and exhibition; after the theatrical release, a film came out in turn on video, pay TV and free-to-air broadcast. Staggering release dates by medium is called hold-back, or windowing. It was a structure for earning from different audiences with the same work.

Streaming services shook this order hard. Works now skip theaters and go straight out worldwide, and more platforms finance and produce directly. YouTube and short-form platforms opened a way for individual creators to skip financing and distribution and meet audiences directly. As production costs fall and distribution barriers disappear, the value of video is shifting more and more to 'who can gather an audience.'

A key concept in this shift is intellectual property, or IP. When one story and its characters expand from webtoon to drama, games and merchandise, the value multiplies. Korean content draws attention worldwide not just through individual hits but through the power of its stories, characters and worlds to carry over into other media.

Seen from the production floor, value doesn't come from technical skill alone. An ad's value comes from solving the brand's problem, an educational video's from helping learners understand, a creator video's from trust with a particular audience. When two people with the same shooting skills command different fees, the reason is usually this difference in problem-solving.

A useful frame for looking at the industry is the value chain. Ask who bears the risk and who takes the profit at each stage: planning and development, production, post-production, distribution, exhibition and consumption. Traditionally, investors and production companies bore the risk, and profit was recouped in distribution and exhibition. In the platform era, much of the risk has shifted to the platforms; in exchange, more production companies take a stable production fee and give up extra earnings tied to performance.

An individual creator's income comes in four streams: commissioned freelance work, a share of platform ad revenue, direct brand

partnerships, and your own business, such as products and teaching. The earlier streams are predictable; the later ones swing widely but have a higher ceiling. Rely on just one and you will be shaken when the market shifts, so it is safer to try at least two from early in your career.

Further reading — Harold Vogel, Entertainment Industry Economics · Chris Anderson, The Long Tail

PART 09 Industry and market trends

9.1 The structure of the video industry

Who commissions, who makes it, and what comes out. Map the eight areas and you will see where you can get in.

Note

Upstream in advertising — the agency handles strategy and planning; production goes down to the production house

Note

Each area has different clients and makers, so the kind of work to put in your application differs too.

Area	Main clients	Who makes it	Typical output
Broadcasting	Terrestrial, general-programming, cable	Outside production companies	Drama, entertainment, documentary
Film	Investor-distributors	Production companies	Features, shorts
Advertising	Advertisers, agencies	Production houses	TVC, digital ads
Digital content	Brands, platforms	Content studios	Web variety shows, branded content

Area	Main clients	Who makes it	Typical output
Corporate PR	Companies, institutions, universities	In-house or outsourced	Promo videos, training videos
Commerce	E-commerce, brands	In-house, small teams	Product-page videos, live streams
Creators	Self, MCN	1 person or a small team	YouTube, short-form
Immersive content	Local governments, museums, brands	XR studios	Exhibitions, projection, VR

Job postings confirm this shift. The way in, once narrowed to broadcasters' open recruitment, has widened to brand content teams, e-commerce companies' video roles and small studios, and most entry-level hiring now comes from these.

Exercise 9.1

Task	Draw the video industry's value chain (planning, production, distribution, consumption) and write the typical jobs at each stage.
Tip	Mark the direction money flows with arrows.
Assessment	Accuracy of structural understanding
Model answer	Marks where they would fit on the map and explains why.

PART 09 Industry and market trends

9.2 Trends in the Korean market

Over the past 15 years, demand for video moved out of broadcast advertising and then into companies themselves. At the end of that path stands generative AI.

Note

The first to feel shifts in Korean demand — production companies have changed character several times in 15 years

01	02	03	04	05	06
Early 2010s	2015–2018	2019–2021	2020–2022	2022–2024	2024–2026
As smartphones and YouTube grow, corporate video demand spreads beyond broadcast ads; the viral video genre is born	Branded content and web variety shows take hold; the line between ads and content blurs and production companies change	Global streamers arrive and drama production demand soars; shortages of camera · lighting · art · post crews	The shift to remote brings a boom in online classes, live commerce and webinars; 1-person production skills gain value	Short-form absorbs ad budgets; brands expand their own production units and in-house video roles	Generative AI enters practice; rates for simple editing · graphics fall, and planning · directing · judgment gain value

T-shaped skills

Deep in one thing, with an understanding of the whole process. That is the shape of skill the market wants now.

What it means for newcomers

Jobs for people who can only edit are shrinking. Jobs for people who can write a proposal, shoot, edit and read the results are growing.

Exercise
9.2

Task	Using articles and reports, research 3 changes in the Korean video market over the past 12 months.
Tip	Always note sources and publication dates.
Assessment	Reliability of sources, reading of trends
Model answer	Goes on to interpret how the changes affect entry-level jobs.

PART 09 Industry and market trends

9.3 Overseas market trends and differences

In North America and Europe, roles are separate, contracts are per project, and showreels state your role. Know the differences and you will know what to prepare.

Note

Abroad, deals happen at content markets and film festivals — a showreel and an English résumé are your ticket in

Aspect	Korea	Overseas (mainly North America, Europe)
Hiring	Open and rolling recruitment mixed; portfolio-based	Almost all rolling; showreel-based
Role specialization	1 person, many roles	Clearly separated roles
Contracts	Full-time jobs preferred	Mostly per-project contracts
Pay structure	Lump-sum negotiation	Day rates and standard rates by role
Working hours	Long hours still common	Set by unions and rules
Portfolio	List of finished works	Role and contribution stated
Language	Korean	English résumé and showreel required

TIP

— If you are considering jobs or clients abroad, prepare an English showreel and résumé in advance.

The international standard is a showreel of about 1 minute with your role captioned on each clip.

— Archives of international ad-festival winners are often free to view. They are the most efficient material for studying structure.

— Overseas freelance platforms are easy to enter but fiercely price-competitive. Leading with expertise in a specific field works better.

Exercise 9.3

Task	Compare one overseas market with the Korean market in production methods, distribution, and revenue model.
Tip	Set the comparison criteria in a table first.
Assessment	Balance
Model answer	Proposes opportunities the differences open up for Korean producers.

PART 09 Industry and market trends

9.4 Advertising · commerce · creators

Advertising, commerce, and creator markets — the six markets with the most entry-level hiring. Each demands different skills and pays on different terms.

Advertising

Agencies and production houses

- Agencies plan, production houses produce
- Digital agencies and small houses growing

Advertising

Branded content

- Openly an ad, consumed as content
- Sponsor labels required; check disclosures

Commerce

Commerce video

- Product pages, demos, review formats
- High volume, low rates, speed matters
- Good training ground for newcomers

Commerce

Live commerce

- Live streaming plus hosting
- Switching, lights, audio, captions at once
- Builds all-round skills

Creators

Creators and MCNs

- Solo channels and support firms
- Steady demand for editors
- Rates vary widely with skill

Immersive content

XR and exhibitions

- Mostly municipal projects, brand pop-ups
- Ordered per project
- Needs both spatial and tech know-how

Exercise
9.4

Task	Estimate and analyze one creator's revenue mix (ads, sponsorships, commerce, donations).
Tip	Use only public information, and label estimates as estimates.
Assessment	Evidence, ethics
Model answer	Lays out the order and conditions for diversifying revenue.

Background 19

What a price pays for

The figure on a quote is not simply the cost of the gear, nor of the hours. A production budget usually splits into three blocks: people's time, equipment and locations, and rights. Beginners most often forget the third. The same video is priced differently for 1 year of in-house training than for 6 months on national TV. The wider the media, term, and territory, the higher the price, and if the quote leaves the scope unstated, the work can end up used without limit.

People's time is not just the shoot day. A project runs from planning meetings and research, script and storyboard, casting and scouting, and the shoot, through editing and revisions, to delivery and invoicing. The less experienced you are, the less time you allow for editing and revisions, yet that is where the most time disappears. The standard defense is a clause that fixes the number of revisions and bills anything beyond as extra.

There are three ways to set a price: hours times an hourly rate, the going rate for similar projects, or the value the client gains. As your career grows, the third carries more weight, because even at the same 30 seconds, a small shop's intro video and the main cut of a national campaign solve problems of very different size. You can price this way only if you can explain what problem your work solves.

In Korea, the standard contracts and industry surveys published by the Ministry of Culture, Sports and Tourism, the Korea Creative Content Agency (KOCCA), and others serve as benchmarks. A standard contract covers payment timing, copyright ownership, scope of revisions, and termination terms, which makes it a good skeleton for a first contract. Amounts change every year, so check the latest figures, but the structure of the items changes little.

Finally, a low price does not bring the next job. Start too cheap and it gets hard to refuse revision requests, and that time is lost to other work. You may take a low fee early on for the experience, but even then, write down the scope and number of revisions clearly. Guarding your price is guarding your time.

Further reading — KOCCA, standard contracts and industry surveys · Ministry of Culture, Sports and Tourism, standard contracts for popular culture and arts · Chris Do, “Sell Value, Not Price”

PART 09 Industry and market trends

9.5 Freelance rates and contracts

Rates vary widely by region, experience, and client size. Rather than absolute figures, learn the structure of a quote and the seven contract clauses.

Note On a freelancer's desk, the edit screen and the invoice sit side by side — quotes and contracts are part of production too

Type	Items	Basis
Planning	Planning fee, outline, storyboard	Per job or planner day rate
Shoot	Director, camera, lights, sound	Crew x shoot days
Gear	Camera, lenses, lights, special gear	Daily rental

Type	Items	Basis
Cast	Models, VO artists, extras	Per session or hour
Venue	Rental, access fees	Hourly or daily
Post	Edit, grade, CG, sound mix	Runtime or work days
Assets	Music, fonts, stock	At cost
Other	Travel, food, insurance, buffer	About 10% of total

Seven things to check in any contract

01 Scope of work: state in numbers how many videos, how many minutes, how many versions.

02 Revisions: unlimited revisions cannot exist. Usually cap them at 2–3 and set a fee for more.

03 Copyright: make clear whether it is a full transfer or a license, and settle whether you may show the work in your portfolio.

04 Usage scope: specify media, term, and territory. Online-only and all-media are priced differently.

05 Payment terms: set the split and timing of deposit, interim, and final payments.

06 Delay and termination: decide how costs are handled when the client postpones the shoot.

07 Supplied materials: write down who provides products, logos, and fonts, and by when.

Note

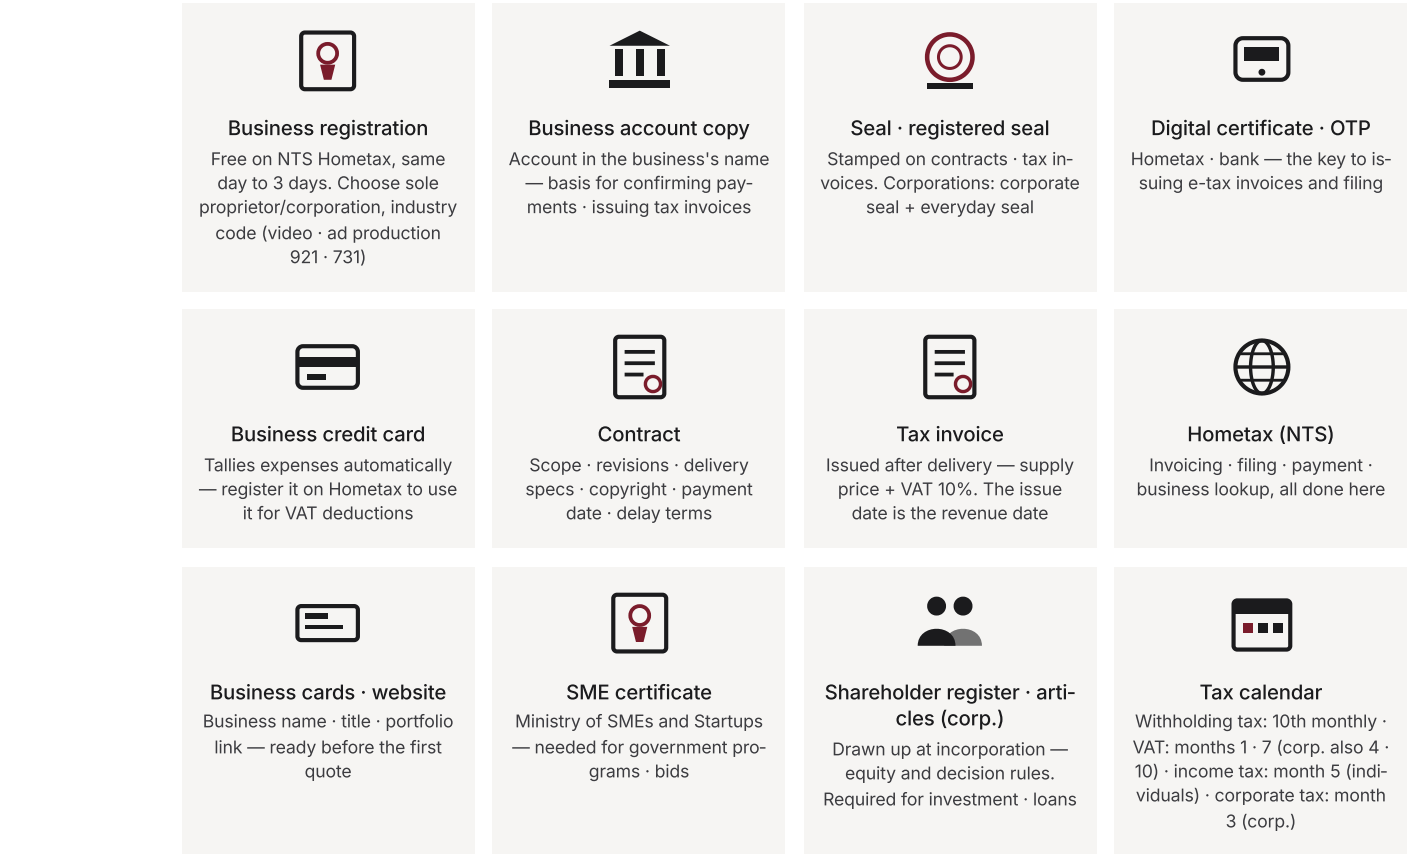
90% of disputes come from revision counts and usage scope. Put both in numbers.

Always include a portfolio clause

Under a no-disclosure contract, even your best work can't help you win the next job. At the very least, negotiate the right to show it after a set period. For newcomers and freelancers, this clause matters more than the rate.

> A low price doesn't bring the next job. A quote with no stated scope only brings more work.
>
> Background 19 What a price pays for

What to have before taking on work — paperwork and taxes at a glance



Sole proprietor vs corporation

Sole proprietor — setup cost 0, income tax 6–45% progressive, owner = business. Suits solo work or small freelance jobs
Corporation — setup cost of a few hundred thousand won + articles · shareholder register, corporate tax 9–24%, the CEO is a salaried employee. Suits investment · government projects · running a team
Both — the 10% VAT is not your money but money you hold. Always write 'VAT excluded' on quotes

Figure 96 A paperwork map for freelancers · studios — the twelve things to set up at once when you start out, and the tax calendar that comes around every year. Not knowing costs money; knowing earns trust.

Exercise 9.5

Task	Write a quote and a simple contract for a hypothetical freelance job.
Tip	Be sure to include revisions, delivery specs, copyright ownership, and payment schedule.
Assessment	Completeness, dispute prevention
Model answer	Checks for missing items against a standard contract form.

PART 09 Industry and market trends

9.6 Career paths by role

Your first role is not your final identity. Here are year-by-year paths for six roles, and the four things that set how fast you grow.

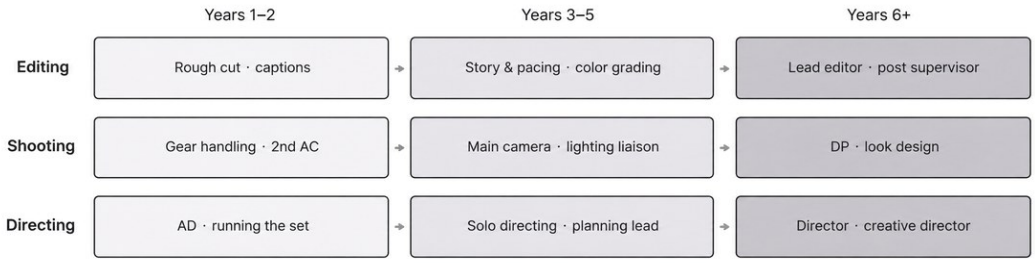


Figure 97 Career paths by role

Editing

From rough cuts to head of post

- Years 1–2: rough cuts, captions, sorting cuts
- Years 3–5: owning structure and rhythm, color grading
- Year 6+: lead editor, post-production supervisor

Camera

From second camera to DP

- Years 1–2: gear care, second camera
- Years 3–5: main camera, lighting coordination
- Year 6+: DP, look design

Directing

From AD to director

- Years 1–2: AD, running the set
- Years 3–5: directing solo, leading planning
- Year 6+: director, creative director

Motion graphics

From templates to art director

- Years 1–2: template work, caption design
- Years 3–5: title sequences, 3D
- Year 6+: art director

Content marketing

From metrics reports to brand lead

- Years 1–2: posting and metrics reports
- Years 3–5: channel strategy, campaign design
- Year 6+: head of brand content

XR planning

From research to winning contracts

- Years 1–2: research, documentation
- Years 3–5: exhibition planning, vendor management
- Year 6+: lead planner, winning contracts

What sets your growth speed

01 Volume. The gap between someone who makes 100 pieces in 1 year and someone who makes 10 can't be closed 3 years later.

TIP

Directing begins the day an editor starts listening in on planning meetings.

02 Feedback frequency. Working alone, you don't improve. Skill is the number of times you show your work and get critiqued.

03 The habit of doing the next level's work ahead of time.

04 Records. Only those who note what they did and why can improve their judgment.

> **Career switches happen more often than you think**
>
> Moving from editing to directing, from camera to directing, or from content marketing to brand planning is common. Don't treat your first role as your final identity.

Exercise 9.6

Task	Map a 5-year path for one role you're interested in, with the skills and outputs for each year.
Tip	Base it on interviews with people in the job or on job postings.
Assessment	Realistic path
Model answer	Links it to three actions you can take this semester.

PART 09 wrap-up

Exercises and review

01 **Reading tone**

Watch three recent works from each of five companies you're interested in and sum up their shared tone in one line.

02 **Writing a quote**

Set up a hypothetical freelance job and write an 8-item quote.

03 **Skill frequency table**

Collect ten job postings and rank the recurring skill requirements by frequency.

One-page summary

9.1 The structure of the video industry	The center of gravity for jobs has shifted from broadcast and film to digital, commerce, and corporate in-house teams.

9.2 Trends in the Korean market	Edit-only jobs are shrinking; jobs that plan, shoot, edit, and read the numbers are growing.
9.3 Overseas markets	Abroad, separate roles and project contracts are the norm. An English showreel that states your role is standard.
9.4 Advertising · commerce · creators	Commerce means volume and speed; creators, wide rate gaps; immersive content, a grasp of space and technology.
9.5 Freelance rates and contracts	Put scope, revisions, copyright, usage, and payment terms in numbers. The portfolio clause matters more than the rate.
9.6 Career paths	Growth speed is set by volume, feedback frequency, doing the next level's work early, and keeping records.
Background 18 · 19	Value comes from solving problems; a price pays for time · equipment · rights. Generative AI lowers the rate for simple tasks and raises the value of judgment.

Questions to consider

Q Which market do I want to work in, and is it growing or shrinking now?

Place yourself on the map in 9.1 and the timeline in 9.2.

Q Which parts of my job will generative AI replace, and which will it leave?

Rates for simple editing and simple graphics fall; deciding what to shoot, explaining it, and getting agreement remain.

Q Field tips

Always state revisions and usage scope on a quote. Put a portfolio clause in the contract. Your first rate sticks for a long time, so don't start too low.

PART 10

A portfolio is not a list of what you did well. It is proof you can be trusted with the next job.

What you make in this PART

1. A portfolio of 5–8 works and a 60–90-second showreel
2. A résumé and cover letter tailored to the role
3. 3 interview answers in STAR format

Jobs and careers

Skill is only skill once it's proven. However well you make something, if you keep it in a form you can't show, it might as well not exist. Facing the question "What kind of video maker will I become?", this PART covers the craft of proof: the portfolio and showreel, the résumé, the interview, and your attitude at work.

Photo P-11 Portfolio review — a conversation over a showreel · generated image

Using this chapter in class

Can tailor a portfolio and résumé to a role

Materials Your own work, Worksheet 6, laptop

10 min	15 min	10 min	10 min	5 min
Intro	Concepts	Plates	Exercise	Wrap-up
Watch only the first 1 min of each other's portfolios and share impressions	How newcomers are judged; writing results in numbers	Portfolio layout and job-prep matrix	Write 3 interview answers in STAR format	The habit of checking link access

> Check point
>
> Does each work state your role and results

PART 10

Introduction

Skill is only skill once it's proven. However well you make something, if you keep it in a form you can't show, it might as well not exist. This part covers the craft of proof.

A recruiter spends 1 to 2 minutes on a portfolio on average. In that short time, they want to know just one thing: if we give this person the work, will they see it through? One finished piece answers that better than one flashy cut. Few applicants submit their proposal and storyboard with the work, so simply showing the process sets you well apart.

The same logic is why interviews and communication get their own sections. Video work looks solitary, but it is really a job of coordinating all day long. The habits of repeating instructions back, sharing progress first, and reporting mistakes immediately are judged before technique. Most of what gets you through your first 3 months at your first job lies here too.

Background 20

What outlasts the tools

Video tools change every few years. The menus of the software you are learning now may well change by the time you graduate. The American radio host Ira Glass has spoken of the 'taste gap' that people starting out in creative work go through. When you start, your taste is already good enough to recognize good work, but your hands can't yet keep up. The only way to close the gap is to keep turning out a large volume of work.

Tool skills matter, but what recruiters and clients finally look at is judgment. Someone who can explain which cuts they dropped, why they chose this angle, and what they prioritized within the deadline and budget adapts quickly when the tools change. That is why a portfolio should hold not just the work but the process and the reasons for your choices.

Video is almost always made collaboratively. The DP, editor, sound designer, client, and actors each speak their own language. A good video maker can translate their intent into other people's language, and takes feedback as information, not emotion. Meeting deadlines, organizing files, and replying when promised: these basics bring the next job.

And what remains in the end is perspective. Given the same tools and the same place, each person sees something different and wants to say something different. In an age when generative AI produces images with ease, this difference matters even more. Anyone can borrow technology, but no one can borrow the ability to judge what is good and say why you are making it.

A useful concept for the first few years of a career is 'T-shaped expertise.' The vertical stroke is the strength to go deep in one field; the horizontal stroke is the breadth to understand neighboring fields and collaborate. An editor who knows the limits of shooting can judge what extra footage to ask for on set, and a DP who knows how the edit flows secures the needed cuts in advance. What a newcomer needs is to do one thing well while understanding the fields beside it.

Remember, too, how to handle feedback. As a beginner, it's easy to take criticism of your work as a judgment of you. But feedback on set is usually information about the output, and the sooner you get information, the better. People who can explain 'why I did it this way' and ask 'what to change, and how' grow far faster

in the same time. The hands-on preparation in chapter 11 is, in the end, practice in this attitude.

Further reading — Austin Kleon, “Steal Like an Artist” · David Bayles · Ted Orland, “Art and Fear”

PART 10 Jobs and careers

10.1 A map of video jobs

What twelve roles do, what they require, and how easy they are for newcomers to enter. Choose a first job where you can watch the whole process.

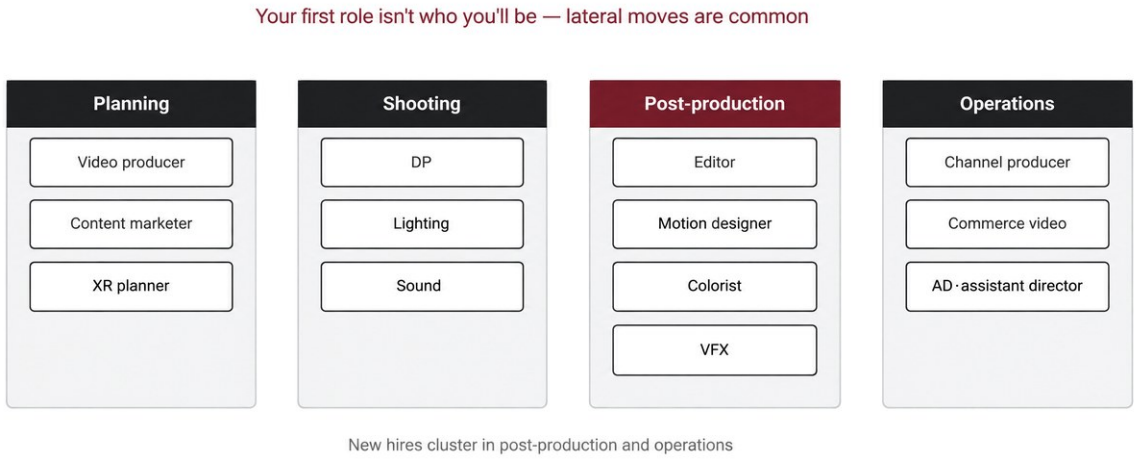

Figure 98 A map of video jobs

Easy entry

Video PD

- Plans, directs, oversees
- Planning, communication, scheduling

Very easy

Editor

- Shapes structure and rhythm
- Editing tools, sense of rhythm, speed

Very easy

Commerce video maker

- Product pages, product videos
- Speed, lighting, product shooting

Very easy

AD (assistant director)

- Assists on set
- Stamina, diligence, tact

Easy entry

Content marketer

- Planning and performance
- Data reading, copy, platform know-how

Easy entry

YouTube channel PD

- Channel strategy and production
- Planning, editing, data

Portfolio matters

Motion designer

- Titles, infographics, VFX
- After Effects, design sense

Start as assistant

DP

- Technical image-making
- Camera, lenses, exposure, composition

Assistant first

Colorist

- Color grading only
- DaVinci, color theory

Specialist training

VFX artist

- Compositing, simulation
- Nuke, Houdini, 3D

Specialist training

Sound designer

- Sound design and mixing
- DAW, audio theory

Experience needed

XR planner

- Exhibitions, immersive content
- Grasp of space and tech

Your first role is not your last

Starting as an editor and becoming a PD, or starting as an AD and becoming a DP, is a common path. Rather than a final destination, choose a first job where you can observe the whole process.

Exercise 10.1

Task	Pick 3 roles from the job map and research a working day in each.
Tip	Gather the 'key duties' from job postings and find the words they share.
Assessment	Specific research
Model answer	Tabulates the tools and portfolio format each role needs.

PART 10 Jobs and careers

10.2 What newcomers are actually asked for

Of someone with no experience, a company wants to confirm just one thing: if we give this person the work, will they see it through?

Area	What recruiters check	Proof
Basics	Are exposure, sound, and captions up to standard	Technical polish of the portfolio
Completion	Have they ever finished something	Record of the process from planning to delivery
Tool skills	Can they use Premiere and After Effects	Screen captures of work, project files

Area	What recruiters check	Proof
Speed	Can they meet deadlines	Production time stated
Teamwork	Have they worked on a team	Team projects with roles stated
Attitude	Do they accept feedback	Interview responses
Trend sense	Do they know what works now	Work from the last 6 months
Metrics sense	Can they read the numbers	Metrics from their channels

> One finished piece answers this question better than one flashy cut.
>
> 10.2 What newcomers are actually asked for

Exercise 10.2

Task	Collect 10 job postings, sort the required skills, and check how ready you are.
Tip	Separate required from preferred.
Assessment	Honesty of self-assessment
Model answer	Plans to close skill gaps through this semester's assignments.

PART 10 Jobs and careers

10.3 Building a portfolio

5–8 works, the strongest first, with role, process, and numbers for each. A portfolio is judged by impression, not by sum.

Note Portfolio review — viewers judge your level by the first piece, within 1–2 minutes

Seven principles of structure

01 5–8 pieces is the right number.

02 The first piece is everything. Recruiters watch for only 1–2 minutes on average. Put your strongest work first.

03 Leave out work unrelated to the role. There is no reason to include photography when applying as an editor.

04 State the role, duration, tools, and purpose for each piece.

05 Show the process too. Proposals, storyboards, set photos, and before-and-after comparisons are stronger evidence than the result.

06 If there are results, add numbers. Views, retention rate, and client response all count.

07 Put recent work up front. If your latest piece is from 3 years ago, it reads as if you've done nothing lately.

Note

List 20 pieces and you are judged on the average. Your weakest piece reads as your level.

Five types you must have

01

One complete ad-style piece

15 or 30 seconds. Work that shows intent and structure. Submit with proposal and storyboard

02

Short-form series

3+ episodes in the same format. Proof you can keep a consistent format

03

Motion graphics

Titles, infographics, 3D text. Direct proof of After Effects skill

04

Interview or documentary

Proves basics like lighting, mics, and captions all at once

05

Personal work

Made without a commission. Shows taste and initiative, and gives you something to talk about in interviews

Submission formats

Format	Pros	Note
Personal website	Freedom, polish	Check load speed and mobile support
Notion page	Quick to build, easy to edit	Check permissions; plain design
PDF	Offline viewing, layout control	Size limits; link videos
YouTube playlist	Instant play	Inaccessible if set to private
Vimeo	Quality, password lock	Load speed in Korea

> **Always check links before submitting**
>
> A portfolio that won't play because of a permissions error is rejected on the spot. Always open it in an incognito window before submitting. Name files so they show your name and role.

Portfolios by role — platforms and how to present

Project style — Behance-type
1 video + one page of process (storyboard · set · before/after). For ad · brand film roles

3D · game art — ArtStation-type
Turntable · wireframe · breakdown. Modeling · look dev

Showreel hosting — Vimeo-type
Ad-free player · password · high quality. The standard for showreel links

Channel style — YouTube
Consistent thumbnail tone · playlists by role. Proves you can run a channel

Case study — UX · motion UI
Problem → process → result. Prototype videos and flow diagrams

Games · interactive
Gameplay video + build download. A devlog is proof of process

AR · VR
Headset footage + phone AR demo + QR. An explainer video is a must for reviewers who can't try it

Media art · exhibitions
Installation views · drawings · visitor reactions · tech specs (tech rider)

Vibe-coded personal site — built in a day with generative coding tools. Three conditions: showreel autoplays (muted) on the first screen · loads within 3 seconds on mobile · four lines per piece: role · duration · tools · results. Gather platform links below that.

Figure 99 Sample portfolio platforms by role — choose not by where you post but by "what you prove." For video, showreel hosting + project style; for 3D, breakdowns; for XR, the explainer video is key.

Exercise
10.3

Task	Choose 5 pieces for your portfolio and write one line each on role, brief, and result.
Tip	Rather than including many, lead with your best.
Assessment	Selection, clear descriptions
Model answer	Makes 'problem → solution' visible at a glance for each piece.

Background 21

What a portfolio proves

A portfolio is not a collection of well-made videos but a bundle of evidence showing what problems you solve and how. Recruiters do not spend long on a showreel. Surveys and field experience agree that whether they keep watching is decided within the first 10 to 20 seconds. Ordering work chronologically or saving your best for later almost always costs you.

According to the serial position effect in cognitive psychology, people remember the beginning and end of a list best. Portfolios follow the same principle. Open with strong work, show range in the middle, and close with strong work again. Padding with ordinary work to add volume lowers the average. A portfolio is judged by impression, not by sum.

What to show depends on the role. Camera applicants must prove light and composition; editing applicants, rhythm and structure. From the same project, pick the passages that reveal transitions and pacing for an editing role, and the scenes that show lighting design for a camera role. Applying to every role with one showreel is like wearing an outfit that fits no occasion.

Showing the process makes the decisive difference. Note briefly your intent, references, storyboard, the constraints on set, and the choices you made within them, and reviewers will read the judgment behind the result. Stories of handling limits, such as a scene solved with natural light for lack of budget or an edit restructured because the schedule slipped, leave an especially strong impression.

Stating your contribution accurately is both ethics and strategy. Clearly noting your part in team work earns trust and makes interview answers easier. Inflated contributions usually come out after one or two specific questions. Even for school or personal projects, if you used commercial assets or music without permission, it is safer to keep them out of a public portfolio.

Finally, a portfolio is not an object you finish but a state you keep updating. Set yourself a rule to drop the weakest piece whenever a new one arrives, and the average keeps rising even if the volume doesn't.

Further reading — Chris Do · The Futur, portfolio review series · Austin Kleon, “Show Your Work!” · KOCCA, hiring trend reports for the content industry

PART 10 Jobs and careers

10.4 Making a showreel

A showreel is a video of about 1 minute that gathers only your best shots. It matters most when applying as an editor, motion designer, or DP.

60–90 s
Past 2 minutes, no one watches to the end

5 s
Your strongest shot in the first 5 seconds. A showreel needs a hook too

3 s
Your weakest 3 seconds set the level of the showreel

Note

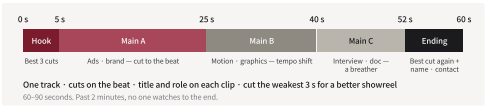
Music violations in a showreel read as a lack of professional sense. Use only cleared music.

- Use a single track and cut to the beat. Rhythm is itself proof of editing skill.
- Caption each clip in small type with the project title and your role.
- Be ruthless with weak shots.

Showreel — choose the cuts, arrange them in 60 seconds

Choosing showreel cuts — contact sheet

Lay out 30 candidate cuts on one screen and narrow them to 9 by asking "does this cut represent my level?" Mix genre · color · rhythm



Structure of a 60-second showreel

Best cut in the first 5 seconds, a rhythm change per genre in the middle, the best cut once more at the end — close on name and contact

Figure 100 Sample showreel — cut-selection sheet and 60-second structure. A showreel is not "a collection of well-made videos" but "60 seconds minus the weakest 3."

Exercise 10.4

Task	Make a showreel of 60 seconds or less.
Tip	Put your best cuts in the first 10 seconds, and your name and contact at the start and end.
Assessment	First impression, rhythm, role labels
Model answer	Makes separate editing · camera · motion versions for each target role.

10.5 Résumé and cover letter

Write achievements as situation, action, result, with numbers. In video jobs, long writing makes people doubt your editing.

Note One résumé page and one showreel — in video jobs, the shorter the paperwork, the better it proves your editing

Section	Do	Avoid
Personal info	Name, contact, portfolio link	Listing needless personal info
Summary	Define yourself in 3 lines	A rambling life story
Experience	Dates, employer, role, results	Duties listed but no results
Projects	Role and contribution in numbers	Claiming team results as your own
Skills	Specific proficiency per tool	Vague wording like 'can use'
Education	School, major, relevant courses	Unrelated certificates
Other	Awards, contests, own channels	Exaggeration

How to phrase achievements

Good

- With the department's Instagram stuck at an average of 500 views, planned a 6-part short-form series built on student interviews and handled shooting and editing, reaching an average of 4,200 views and gaining 380 followers over 3 months.

Bad

- Produced a department promo video.

What actually gets read in a cover letter

- Why this company. Why this role. People with a reason stay the course.
- A failure and how you dealt with it. Companies hire people who recover over people who are perfect.
- What you want to learn. The will to grow is the cheapest yet most powerful evidence.
- Keep sentences short.

TIP

Unless you mention the company's recent work specifically, every letter reads the same.

Exercise 10.5

Task	Pick one company to apply to and write a résumé and cover letter.
Tip	Make your results concrete with numbers or responses.
Assessment	Fit for the role, specificity of writing
Model answer	Cites the company's recent work and proposes where you could contribute.

PART 10 Jobs and careers

10.6 Interview prep and practice

Every question has a real intent. Read it, lead with your conclusion, and back it with one example.

Note Interview — play the work and speak in order: intent, problem, solution, result

Question	Real intent	How to answer
Walk us through one portfolio piece	Can you explain your own work	Intent, problem, solution, result, in order
Your hardest project	Problem-solving	Specific case and reasoning
What do you do with feedback	Teamwork	Accept, then confirm
A recent video you admired	Trend sense	Explain why, through its structure
What tools do you use	Job-readiness	Mention your speed along with the tools
On a tight deadline	Responsibility and realism	Give your criteria for priorities
What could be better in our videos	Critical thinking, attitude	Be respectful, but offer concrete fixes
Where will you be in 5 years	Staying power	A realistic plan tied to the role

What not to do, and what to ask back

TIP

Be ready to answer down to the lens you used and the editing time. Bring at least two questions of your own.

Questions worth asking back

- What will I mainly work on in my first 3 months
- What does the team's production pipeline look like
- How is feedback given and received
- How do you judge good performance in this role
- What equipment and software do you work with

What not to do in an interview

- Not remembering the details of your portfolio work
- Talking as if you did all of a team's work. It shows the moment anyone checks
- Criticizing a former team or school
- Asking only about pay, not about the work. And vice versa
- Saying you have no questions

Exercise 10.6

Task Film a mock interview and analyze your answers.

Tip Lead with the conclusion and back it with one example.

Assessment Answer structure, attitude

Model answer Also submits a second interview video, revised after watching the recording.

PART 10 Jobs and careers

10.7 Work attitude and communication

Video work is a job of coordinating all day long. The habits of repeating back, sharing first, and reporting at once are judged before technique.

Note

Industry networking — video work continues through communication on and off set. Attitude is judged at the first meeting

01 Arrive before the agreed time. One person's lateness can wreck the whole schedule.

02 If you don't know, ask right away. Cleaning up what you did without knowing costs far more.

03 Repeat instructions back to confirm them. Ten people will read "grade it a bit warmer" ten different ways.

04 Share progress first. Whoever speaks up before being asked earns trust.

05 Report mistakes immediately. A late report becomes a bigger problem than the mistake.

06 Keep files and folders organized. A structure anyone else can open and understand is the professional standard.

07 Handle equipment with care. How you treat the gear reads as how you treat the work.

Giving and receiving feedback

When receiving feedback

- Hear it out first
- Ask to confirm instead of making excuses
- Repeat back what to fix and by when
- Separate your feelings from the work
- After fixing, report what you changed

When giving feedback

- Be specific, down to the timecode
- No "it's lacking overall"
- Say what works first
- Offer an alternative
- Don't single people out in public

TIP

Exchanging notes by timecode cuts revision time in half.

Sample feedback notes

0:04 caption appears 0.3 s late / 0:12 cut comes after the action ends, drags / 0:19 face is dark, raise gamma / 0:27 logo on screen 1 s too short.

Exercise 10.7

Task	Record 3 pieces of feedback you received during a team project and how you responded.
Tip	Take feedback as information about the work, not as emotion.
Assessment	Communication, visible progress
Model answer	Compares the work before and after feedback to show growth.

PART 10 Jobs and careers

10.8 First 3 months and growth paths

Learn the setup, gain speed, earn trust: three steps in three months that set your next 3 years.

Note

First 3 months — month one is for learning the folders, file rules and approval chain

01	02	03	04	05	06
Month 1 · Learn the setup	**Month 2 · Gain speed**	**Month 3 · Earn trust**	**Month 6 · Expand your role**	**Year 1 · Pick a specialty**	**Years 2–3 · Judgment**
Folders, file rules, approval chain, go-to templates	Automate routine work with presets and templates	Carry out one improvement nobody asked for	Join planning; run a small project solo	Choose what you do best and dig deep	Evaluate others' work and set direction

Exercise
10.8

Task	Plan your first 3 months on the job, week by week.
Tip	List what you must learn under tools, people and rules.
Assessment	Realism of the plan
Model answer	Even includes a list of questions to ask seniors.

PART 10 Jobs and careers

10.9 Hiring case studies

Five cases that typify real career paths. No personal details are included; the aim is to see how each path is built.

Case A

From editor to channel PD

- YouTube editing job in college, 3 videos a week for 6 months
- MCN editor after graduation; 1 year on, joined planning meetings and became channel PD
- Key factor: compiling and sharing view data every week

Case B

From department promos to in-house

- Made a department promo short-form series as a term project, posted on the real school account
- Put view and follower growth figures in the portfolio; joined a mid-size brand's content team
- Key factor: the only applicant with real performance numbers

Case C

Motion graphics specialist

- Uploaded 1 short motion piece a week to a personal account for 1 year
- At 50 pieces, freelance inquiries began; joined a motion graphics studio after graduating
- Key factor: the sheer volume consistency produced

Case D

The on-set route

- Repeated set-assistant gigs in school; as the lighting crew's junior, learned the gear and set lingo
- Joined a production camera team after graduating
- Key factor: trust and contacts built on set, stamina, never being late

Case E

Starting in commerce video

- Hired to make e-commerce product-page videos; made hundreds in six months
- Gained speed and an eye for product lighting, then moved to ad production
- Key factor: skill built by an overwhelming workload

In common

What the five cases tell us

- No special gear, no famous awards
- They had a body of finished work
- They could speak in numbers
- They kept at it

Exercise
10.9

Task	Interview one graduate about how they got hired and write a case report.
Tip	Ask about failures and fixes, not just what worked.
Assessment	Concrete detail
Model answer	Applies principles from the interview to one's own plan.

PART 10 Jobs and careers

10.10 Freelancing and startups

Freelancers run on trust more than skill. The next job goes to whoever meets deadlines.

Note A one-person business's desk — quotes and invoices sit beside the camera gear

Note

Revision count and usage scope: these two cause 90% of disputes. A verbal agreement carries no weight in a dispute.

01 Your starting rate sticks for a long time. Start too low and it is hard to raise.

02 Always use a quote and a contract, and put revision count and usage scope in the contract.

03 Check taxes, social insurance and business registration in advance. Once income passes a certain level, you must sort them out.

04 Before going full-time, set aside 3 months of living costs for slow periods.

05 Run a personal channel or blog on the side and inquiries come in at no sales cost.

Exercise 10.10

Task	As a solo creator, make a 1-page service sheet and a price list.
Tip	State what you offer, to whom, for how much and within how many days.
Assessment	Service clarity
Model answer	Designs three tiers: basic · standard · premium.

PART 10 Jobs and careers

10.11 Sample portfolio page layout

The standard layout for a page presenting one piece. Apply the same format to all 5–8 pieces and that alone shows professionalism.

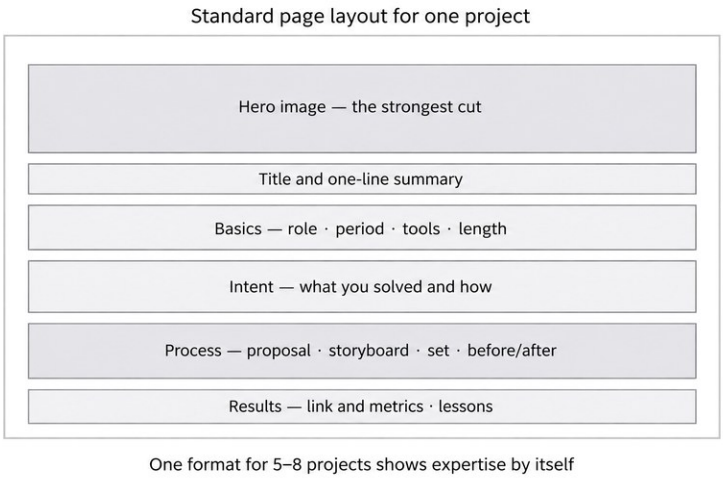


Figure 101 Standard portfolio page layout

01	02	03	04	05
Hero image	**Title and basics**	**Intent**	**Process and results**	**Lessons learned**
The strongest frame of the piece, full width	1 line on what the video is for + 1 table: role, timeframe, tools, runtime, client or not	3–5 lines on what problem you solved and how	3–4 images (proposal, storyboard, set, before/after) + video link and 1 line of results	2–3 lines: what you'd change next time

> **Always include lessons learned**
>
> Knowing your own limits earns more trust than a flawless result. One line, 'next time I'd add one more light,' proves technical judgment.

Sample one-page resume

Contact	Hong Gil-dong | Video content production | 010-0000-0000 | Email | Portfolio link
Summary	2 years in short-form and ad video. Handles planning to editing solo. Avg. retention on channels run: 58%.
Experience	2025.03 - present OO Studio, video editor - 3 brand short-form videos a week, 140 a year - Standardized caption templates, saving 40 min per video

TIP

A three-line summary, numbers for experience and projects, per-tool proficiency for skills. One page is enough.

Projects	2024 Department promo short-form series, 6 episodes: planning, shooting, editing - Avg. views up from 500 to 4,200, net 380 new followers
Skills	Premiere Pro (advanced) / After Effects (intermediate) / DaVinci Resolve (basic) / Sony a7-series shooting / 3-point lighting setup / chroma key compositing

Exercise 10.11

Task	Build a real online portfolio page and submit the link.
Tip	Put your best piece and a one-line intro on the first screen.
Assessment	Structure, loading, mobile readability
Model answer	A visitor can grasp the creator's strengths within 30 seconds.

PART 10 Jobs and careers

10.12 Online communication and remote collaboration

Much of the job happens over messenger and email. Even a well-made video loses points if it is handed over clumsily.

Note Remote collaboration — across a screen, all they have is the link, changes made, review request and next step

Basic format for sending work

Hello, this is OOO. Here is the 1st cut of the 15-second ad you requested. 1. Link: (URL) no password, downloadable 2. Changes made: logo timing changed per our last meeting, caption font replaced 3. Please check: whether the music transition at 0:08 works 4. Next step: 2nd cut within 2 days of your feedback. Thank you.

TIP

Give the next step up front. Not keeping people waiting is the heart of trust.

- Always check that a link opens in an incognito window before sending it.
- Spell out what you want checked. With only "please review," the other side won't know what to look at.
- Put the project name, version and date in the file name.
- Reply to revision requests organized by timecode. Anything traded verbally will get lost.

Rules for collaboration tools

Tool type	Use	Note
Messenger	Quick checks, scheduling	Always put decisions back in writing
Video review tool	Timecoded feedback	Agree on versioning rules
Cloud storage	Sharing sources and outputs	Check permissions and space
Shared docs	Proposals, meeting notes	Check edit history when co-editing
Scheduling	Share deadlines, shoot days	Flag changes at once

When conflict arises

01 Fact vs. interpretation
First lay out what actually happened

02 Call or meet
Text amplifies emotion

03 Go by the documents
The PPM and contract carry weight here

04 Solutions first
Raise only problems and people get defensive

05 Record the outcome
Put the conclusion back in writing

Exercise
10.12

Task — Run one team project on remote collaboration tools and compile the communication log.

Tip — Agree on file naming and versioning first.

Assessment — Clear communication, file management

Model answer — Runs a shared board that shows progress without meetings.

PART 10 Jobs and careers

10.13 Interview question bank by role

Questions that come up again and again in real interviews. Practice your answers out loud beforehand. What is clear in your head is not what comes out of your mouth.

Common questions

Q Introduce yourself in one sentence.
Fit your role, your strength and one piece that proves it into one sentence.

Q Which portfolio piece do you care about most, and why?
Answer in order: intent, problem, solution, result.

Q Tell us about your hardest job and how you solved it.
Give the specific situation and your reasoning.

Q When a deadline is tight, what do you give up first?
Explain how you set priorities.

Q Have you ever struggled to accept feedback?
Explain how you took it on and how you checked it.

Q What have you learned in the last 6 months?
Tie your answer to recent work.

Q Name one piece of our content that impressed you and one that fell short.
Be respectful, but offer a concrete improvement.

Q What do you see yourself doing in 5 years?
Give a realistic plan tied to the role.

In-depth questions by role

Q Editing
How long does a rough cut usually take / How do you decide where to cut / Why use proxies

Q Shooting
How do you set up in a dark interior / Why lock the shutter / Which lenses have you used

Q Directing
What do you do when ideas run dry / If you disagree with the client / The concept in one sentence

Q Motion graphics

Why use easing / Steps to seat 3D text in live action / Have you used expressions

Q Content marketing

If views are low, what do you check first / Hashtag strategy / A campaign that failed

Q XR planning

How do you calculate dwell time / What if equipment fails / What to check in a site survey

STAR answer structure

S	T	A	R
Situation	**Task**	**Action**	**Result**
One sentence on what the situation was	One sentence on what your job was	Two or three sentences on exactly what you did	One sentence on the outcome, in numbers if possible

TIP

On the day: open your links on both phone and laptop, review each piece's timeframe · gear · role, have a one-line take on 3 recent works by the company, two questions, arrive 10 minutes early.

Sample STAR answer

With views on the department account stalled (S), I took on planning and editing a short-form series (T), made 6 episodes in a student-interview format and fully redesigned the first 3 seconds (A), and raised average views 8-fold in 3 months (R).

Exercise 10.13

Task	Pick 10 questions from the interview question bank by role and write your answers.
Tip	Tie every answer to an example from your own work.
Assessment	Specific answers
Model answer	Prepares for likely follow-up questions too.

PART 10 Jobs and careers

10.14 Feedback cases from student work

Twelve criticisms that come up again and again in critiques, and how to fix them. Check against this list before you submit.

Issue	Cause	Fix
The opening drags	Opens on a logo or fade	Move the strongest scene to the first cut
I don't get what it's saying	Two or more messages	Keep one, cut the rest
Sound is quiet and muffled	Camera's built-in mic	External mic, loudness normalization
Faces are dark	Backlit, no fill	Reflector, or reset exposure
Color shifts cut to cut	Auto white balance	Lock manually, shot-match in post
Cuts feel choppy	Cut after the action ends	Cut mid-action
Captions are unreadable	Small type, low contrast	Bigger type, add outline or backing
The middle is boring	Same-length cuts, repeated	Vary cut lengths, add inserts
The ending fizzles out	No planned ending	Longest cut and logo go last
Composites look pasted on	No shadows or grain	Contact shadows, matched grain
Out of step with the music	Music laid on last	Lay music first, then adjust cuts
Cropped in vertical	Framed for horizontal only	Use a vertical safe-area guide

How to present at a critique

TIP

A video that needs explaining already has a problem. Rebuttals can wait until after the fix.

01	02	03	04	05
Work first	**One sentence**	**Self-review**	**Ask for specific feedback**	**Take notes**
Play the piece first, explain later	State your intent in one sentence	Say what worked and what didn't before others do	Edit rhythm, color, or sound	Write criticism down, no excuses

Exercise 10.14

Task	Give a peer feedback using the 'strengths · improvements · next try' frame.
Tip	Cite specific timecodes.
Assessment	Specific, respectful feedback
Model answer	Practical enough that the peer can actually make the fixes.

PART 10 Jobs and careers

10.15 Job-hunting tips

Five things to prepare before applying, how to score on paper, where interviews are decided, and habits to get you through your first 3 months.

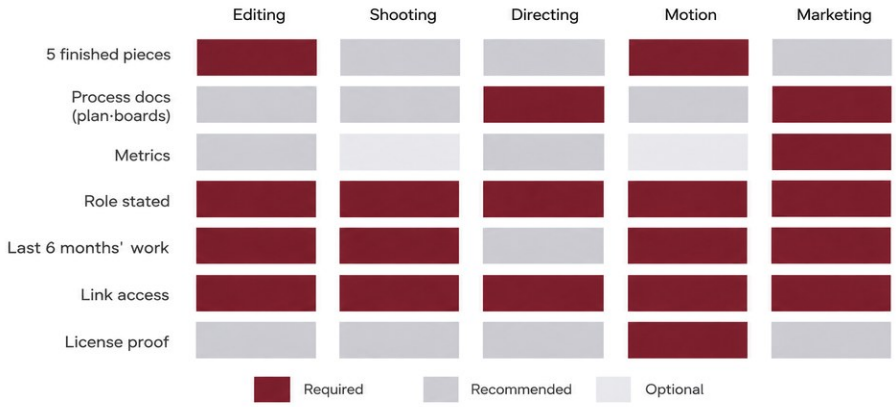

Figure 102 Job-prep matrix by role

Before you apply

01
Five companies
Watch three recent works from each; after fifteen, you see the market's tone

02
Work that fits the tone
Check your portfolio has some; if not, make a piece before applying

03
Swap the lead piece
Fit it to the role. Reordering for each company is diligence, not a trick

04
Three-line summary
Rewrite it for each company. Recycling one file usually shows

05
Check links
In an incognito window. A permissions error gets you rejected on the spot

How to score points on paper

TIP

Views, retention, follower growth, number of videos made and time saved are all valid numbers.

- Include numbers and state your role. If you don't say what you did on a team project, no one can assess it.
- Attach process materials. Few applicants submit proposals and storyboards, so that alone sets you apart.
- Write one line about a failure. A sentence like 'next time I'd add one more light' proves technical judgment.
- In your reasons for applying, cite specific work by the company.

Where interviews are often decided

Situation	Scores low	Scores high
Explaining your work	I tried to make it look nice	I solved this problem this way
Failure question	Nothing in particular	This call was wrong, and here's how I changed it
Tool question	I can use it	I finish this task in X hours
Feedback question	I do as I'm told	I check the intent and offer two options
Deadline question	Even if it takes all night	Here's how I set priorities
Your turn to ask	None	What will I mainly do in the first 3 months

Work habits to get through your first 3 months

01 Repeat instructions back to confirm.

02 Report progress before you're asked. Trust comes from predictability more than from output.

03 Report mistakes immediately.

04 Turn repetitive tasks into templates and presets within the first month. That is what buys you room in month two.

05 Open seniors' working files and study their structure. You learn more from project files than from finished pieces.

06 Speak up at least once in every meeting. Quiet new hires are treated kindly but not remembered.

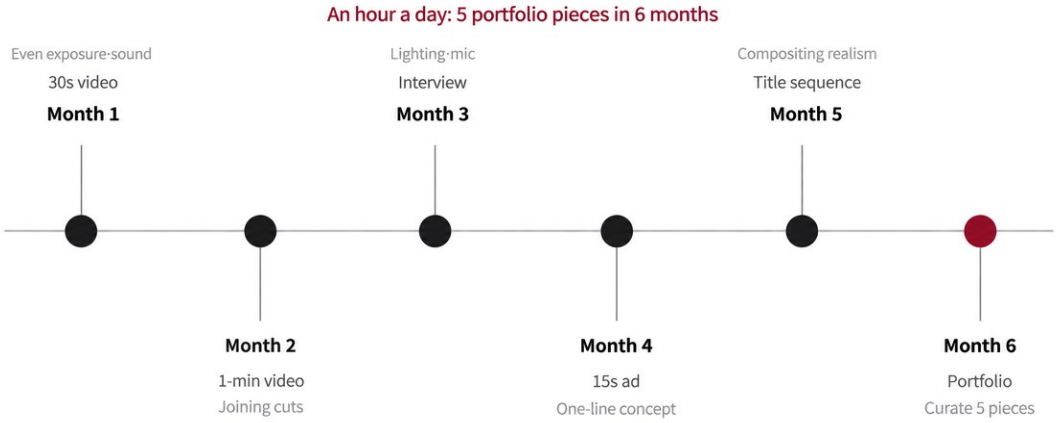

Figure 103 6-month portfolio roadmap

The fastest route with no experience

Don't wait for commissions; create your own clients. Make videos with a real purpose, for a local shop, a department event or a friend's work, and they become your track record. Professional experience is defined not by whether you were paid but by whether you made it for someone's purpose.

Exercise 10.15

Task	Make a job-prep checklist for this semester and review it every week.
Tip	Only small steps get done.
Assessment	Completion rate
Model answer	At semester's end, links checklist results to next semester's plan.

PART 10 Jobs and careers

10.16 Beyond the tools

What will you say? This book has spent hundreds of pages on technique, but one sentence should remain at the end: an editing tool is only a tool.

Software changes its interface within 3 years, and within 5 a new tool replaces the standard. The shortcuts you know by heart today will be strange relics to the next generation. But the ability to decide what to show, to explain that choice and to design where the audience's eye goes keeps accumulating.

> Technique wears out; judgment builds up.
>
> 10.16 Beyond the tools

Generative AI has made this distinction sharper. The cheaper it gets to make a plausible image, the more valuable the person who can say why it must be this image. Having something to say has become harder than learning tools fast.

> **The thesis this book has carried throughout**
>
> Video is not technique but language. Learning a language is not memorizing grammar; it is saying exactly what you mean. We learn aperture not to get exposure right but to decide where the audience looks. The moment that order flips, we may become technicians, but never creators.

Exercise 10.16

Task	Answer 'What do I say through video?' in one sentence, then make a 1-minute video that proves it.
Tip	Write down the problems and people you care about, not tool names.
Assessment	Clarity of theme
Model answer	The sentence and the video explain each other.

PART 10 Jobs and careers

10.17 The age of the one-person company

And the power of culture. Creators no longer just make work; they run themselves as a business. And the accumulation of that skill becomes the power of culture.

Long ago, Lee O-young said an age was coming when each individual would become a company. Then it was a metaphor; now it is a description. Planning, shooting and editing on one smartphone and distributing worldwide is now a reality. That is why this book covers not only planning and production but platform management, reading results, contracts and careers.

In Baekbeom Ilji, Kim Gu wrote that what he wanted was not a rich and powerful nation but one with a high power of culture, because the power of culture makes us happy and brings happiness to others. It was a bold declaration, setting culture as a national goal at a time with neither military nor economic might.

Remember

This is not the achievement of a few geniuses. It is the accumulated skill of tens of thousands, and that skill begins with education.

Korean video content now stands where that sentence has come true. It wins at Cannes and the Academy Awards, sets global streaming viewing records, and its fusion of music and video has become one of the world's standards. The readers of this book will supply that skill for the next generation. Getting exposure right, recording clean sound, cutting for a reason, meeting deadlines. That accumulation becomes the power of culture.

> **Final task**
>
> Close every table and diagram in this book and write down, in one sentence, what you want to say right now. If you can turn that sentence into 15 seconds, this book has done its job.

Exercise 10.17

Task	Make a 30-second intro video for a one-person company branded with your own name.
Tip	Say why you do it before what you do.
Assessment	Identity, polish
Model answer	Logo, color and even tone of voice form one world.

PART 10 wrap-up

Exercises and review

01 **Portfolio table**

Pick 5–8 pieces and tabulate each one's role, timeframe, tools and results.

02 **Showreel**

Make a 60–90-second showreel with a role caption on each clip.

03 **STAR answers**

Write three interview answers and practice them aloud.

04 **Delivery email**

Write one delivery email using the template in the appendix.

One-page summary

10.1 · 10.2 The job map and how new hires are judged	A company wants to know one thing: hand this person a job, and will they see it through?
10.3 Building a portfolio	5–8 pieces are enough. Your weakest piece is read as your level.
10.4 Showreel	60–90 seconds, strongest scene in the first 5 seconds, a role caption per clip, cleared music.
10.5 Resume and cover letter	Write achievements as situation, action, result, with numbers.
10.6 · 10.13 Interviews	Know your portfolio's details. You must be able to answer down to lenses and editing hours. Answer with STAR.
10.7 · 10.12 Attitude and communication	Repeat instructions back, share progress first, report mistakes immediately.
10.8 · 10.9 Growth paths and cases	What sets the pace of growth is not talent but volume of work and frequency of feedback.
10.11 Portfolio page	A portfolio of results alone doesn't stand out. Show the process and lessons too.
10.10 · 10.15 Freelancing in practice	Use quotes and contracts, and rather than waiting for commissions, create your own clients.

10.16 · 10.17 Beyond the tools	Technique wears out; judgment builds up. Video is not technique but language.

Questions to consider

Q When a recruiter looks at my portfolio for 1 minute, what do they see?

Your first piece, and the role · timeframe · tools · results listed with it. Build it as if that is all they see.

Q Whom do I want to work with? Am I that kind of person?

Check yourself against the seven basics in 10.7.

Q Field tips

Repeat instructions back to confirm. Report before you're asked. Template repetitive work within the first month. Open seniors' project files, not their finished cuts.

PART 11

What stays when the tools change — the eye, the promise, the finish.

PART

11

What you make in this PART

1. Per-stage estimates: traditional vs AI production
2. A production flowchart with stop criteria and locked zones
3. A one-sentence key message and a 7-page proposal
4. 5 role-targeted portfolio pieces, contribution marked

Practice and careers in the AI transition

If machines can make images, what work is left for people? This PART gathers well-sourced production cases and hiring-market numbers to see what generative tools made cheap, and so what they made valuable. On that basis it covers the expertise students should build and the practice of planning · copy · portfolios.

Photo OPEN-12 PART divider, full-page photo · generative image

Using this chapter in class

Read in numbers how generative tools have changed production and the job market, decide which cuts call for traditional or AI production, and turn your work into a record of judgments that leads to a job.

Materials 1 recent ad from a brand you like, 10 printed job postings, a list of your work to date, pens

10 min	20 min	30 min	30 min	30 min
Intro	Read cases	Judgment drill	Read the market	Wrap-up
Read a '6 weeks to a few hours' type article and ask what is being compared	In the public case tables of 11.1–12.3, find and mark counts generated and used, and selection time	With the 11.7 criteria, sort an ad cut by cut into traditional · AI, one line of reason each	Sort 11.8 · 11.10 job postings by visual grammar · tools · consistency · collaboration · reading results	Present 1 of your works in 11.14's four sentences: 'intent-constraint-choice-result'

Check point

Can you state in one sentence the judgment you made with a tool, rather than its name?

Background 22

What gets expensive when tools get cheap

In 1965, Intel co-founder Gordon Moore published his observation that the number of components on an integrated circuit doubles at regular intervals. What matters in this rule of thumb, known as Moore's law, is not the number but the consequence. When a resource keeps getting cheaper, people change how they work so as to use it freely. Economists describe this as complements rising in value. When one thing gets cheap, what is used alongside it becomes more valuable.

For the past 100 years, the most expensive thing in video production was 'the cost of one more take.' Every foot of film, every day of cast and crew, cost money. So every production practice, from storyboards to rehearsals to test shoots, was designed to reduce

failure. When digital shooting eliminated the cost of film, the first thing to change on set was the number of takes.

Generative tools go one step further. The cost of making a draft has fallen close to 0. Getting three concept images once meant days of an illustrator's time, so you thought long about which three to ask for. Now you can see 100 in 30 minutes. The hard thinking has moved from 'what to ask for' to 'what to choose.'

So what got expensive? First, judgment. The ability to tell which of 100 images fits the brand and will work for the audience cannot be generated. Second, trust. When anyone can make a plausible image, what clients pay for is not the image but the assurance that 'hand it to this person and it gets done, responsibly.' Third, the real thing. The value of shooting what cannot be generated, such as real products, real stores and real people's faces, has actually gone up.

Knowing this structure also makes clear where students should spend their time. You can learn to operate a tool in a few days. But the ability to say why a cut works, the trust that comes from meeting deadlines and the eye that reads light on set respond only to accumulation. There is one yardstick for reading the numbers in the sections ahead: what did this change make cheap, and so what did it make valuable?

PART 11 Practice and careers in the AI transition

11.1 How much production time has shrunk

Claims that generative AI changed ad production have poured out since 2024, but few cases publish numbers, and those that do disagree. Using only well-sourced cases, we first ask what exactly each number compares.

About 1 yr → about 1 mo

Coca-Cola holiday ad (2025) production time

300–400 → 15 cuts

Kalshi NBA Finals ad: generations vs cuts used

1/5

CJ ENM AI feature film (2026) production cost

1/10

MBC drama crowd · action scene cost (best case)

Case	Production setup	Published figures	Source
Kalshi NBA Finals ad (2025.6)	1 director, Google Veo 3	About $2,000 · 2–3 days · 15 cuts used from 300–400 generations	Creator interview
Coca-Cola holiday ad (2025)	Core team of 5 AI specialists	70,000+ clips generated · about 1 month to make (formerly about 1 year)	Company · press reports
Toys"R"Us brand film (2024.6)	Agency + OpenAI Sora	Hundreds of cuts → dozens · weeks	Agency release
Innocean × Hyundai (2024.6)	15+ AI technologies	One of Korea's first all-AI campaigns (time · cost undisclosed)	Trade media
CJ ENM AI feature film (2026)	Actors act, AI does the rest	Cost about 1/5	Press reports
MBC drama crowd · action (2026)	Broadcaster in-house	Scene cost as low as 1/10	Press reports

Note

Dramatic figures like '6 weeks to a few hours' usually come from a single outlet and can't be confirmed in the original source. When you cite one, give the source and conditions.

What to watch for in the numbers

What shrank

- Generation cost — Kalshi used 15 cuts from 300–400 generations, a hit rate of about 5%
- Production time — Coca-Cola, from about 1 year to about 1 month
- The kinds of work people do

What didn't shrink

- Total headcount — Coca-Cola's generation core was 5, but the whole campaign still took about 100 people, as before
- Selection time — choosing among 70,000 clips takes human time
- The burden of checking figures with unclear baselines

Industry-wide adoption

About 50%

IAB 2025 survey — advertisers already making video ads with generative AI. 86% of buyers use or plan to; generative creative projected at 40% of all ads in 2026

32.1%

KOCCA 2025 — share of content companies using generative AI. Games 70.0%, animation 51.6%, advertising 40.9%, broadcast video 31.9% (2023: 7.8%, 2024: 13.2%)

15/66 ads

Super Bowl ads (2026.2) counted as using AI in production. Only 1 was stated as fully AI-generated

The claim that 'advertising has gone all-AI' is not yet true.

> When you hear production time has shrunk, ask back: What was generated, how many were made and how many used, and how many days did choosing take?
>
> 11.1 How much production time has shrunk

Exercise 11.1

Task	Pick a recent ad from a brand you like and, in a table, estimate stage by stage what it takes the traditional way and with generative tools. Give one line of reasoning per estimate.
Tip	Break it into planning, storyboard, booking, shooting, editing, revisions and delivery. Underestimating revisions is the most common error.
Assessment	Are the estimates backed by reasons? Are both shrinking and growing stages identified?
Model answer	An estimate whose table shows that time saved by generation returns as 'selection and correction' time.

PART 11 Practice and careers in the AI transition

11.2 Reshaping the pipeline

How has the pipeline been rebuilt? Traditional production flowed one way: planning → shooting → post-production. With generative tools the flow has become a loop, and settling the concept and making the final images now happen at the same stage.

01	02	03	04
Prompt	**Generate**	**Select**	**Revise**
Write references and conditions in words	Make many variants at once	Pick what meets the criteria	Fix the prompt, back to 01

From one-way flow to a loop — decisions stay open to the end

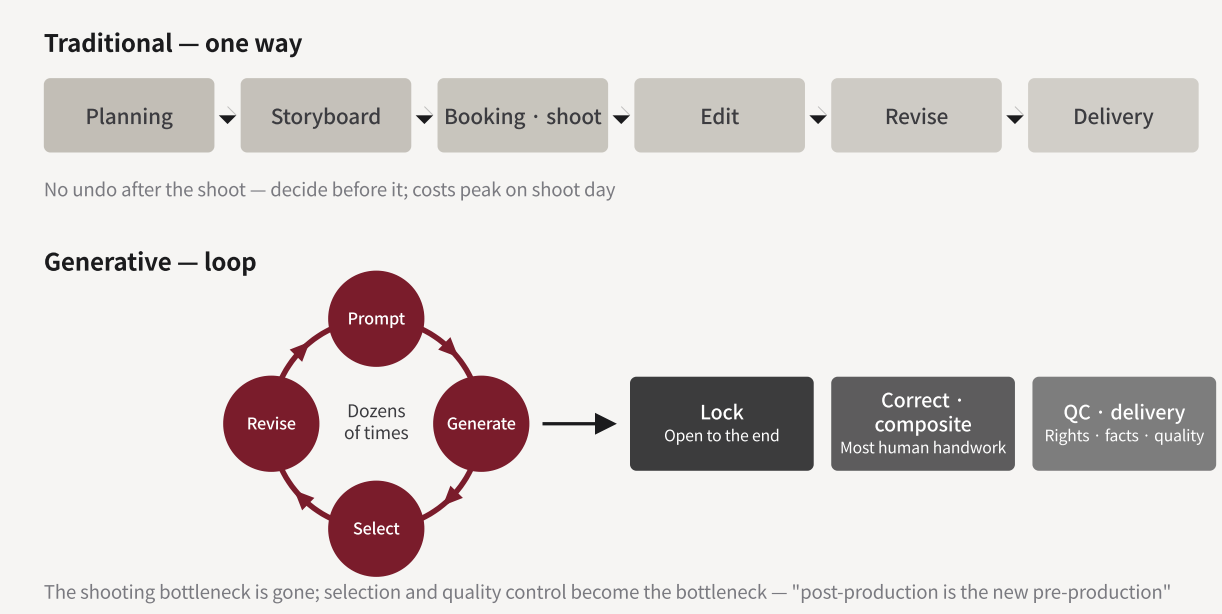

Figure 104 Reshaping the pipeline — top, the traditional linear structure; bottom, the generate ↔ select ↔ revise loop. Deciding how many laps of the loop to run is the new scheduling.

Term

'Post-production is the new pre-production.' A line from Coca-Cola's making-of video that sums up a structure in which decisions stay open to the end.

The two structures compared

Traditional linear structure

- Order — planning → shooting → post
- Undo — no going back a stage
- Decisions — mostly locked before the shoot
- Bottleneck — shoot schedule and budget
- Risk — miss it on set and it's over
- Control needed — advance planning

AI iterative structure

- Order — a generate ↔ select ↔ regenerate loop
- Undo — regenerate any time
- Decisions — open to the end
- Bottleneck — selection and quality control
- Risk — endless revisions stretch the schedule
- Control needed — stop criteria and selection criteria

Work that grew and work that shrank

New roles

Generation specialist · workflow designer · curator · reviewer

- Curation that filters mass output
- Brand and legal review
- Orchestration that ties many tools into one reproducible flow

Shrinking work

Simple repetitive tasks

- Basic rotoscoping and cleanup
- Banner size variants, repetitive asset production
- In a US agency survey, over half of firms cut or stopped entry-level hiring

Unchanged work

Judgment and coordination

- Supervising, art direction
- Decision-making with the client
- Judging key cuts and continuity from cut to cut

Three safeguards that keep the schedule intact

01 **Stop criteria** — Decide in advance: 'after N generations, choose from those.' Without a rule, you keep making more even after a good result.

02 **Locked zones** — First lock what must not change, such as the product, logo and key message, then vary the rest.

03 **Version log** — Record which prompts and references produced which results. Work you can't reproduce can't be remade when revision requests come.

> Generation is infinite; schedules are not. Before you start, write down 'how many to make before stopping.'
>
> 11.2 Reshaping the pipeline

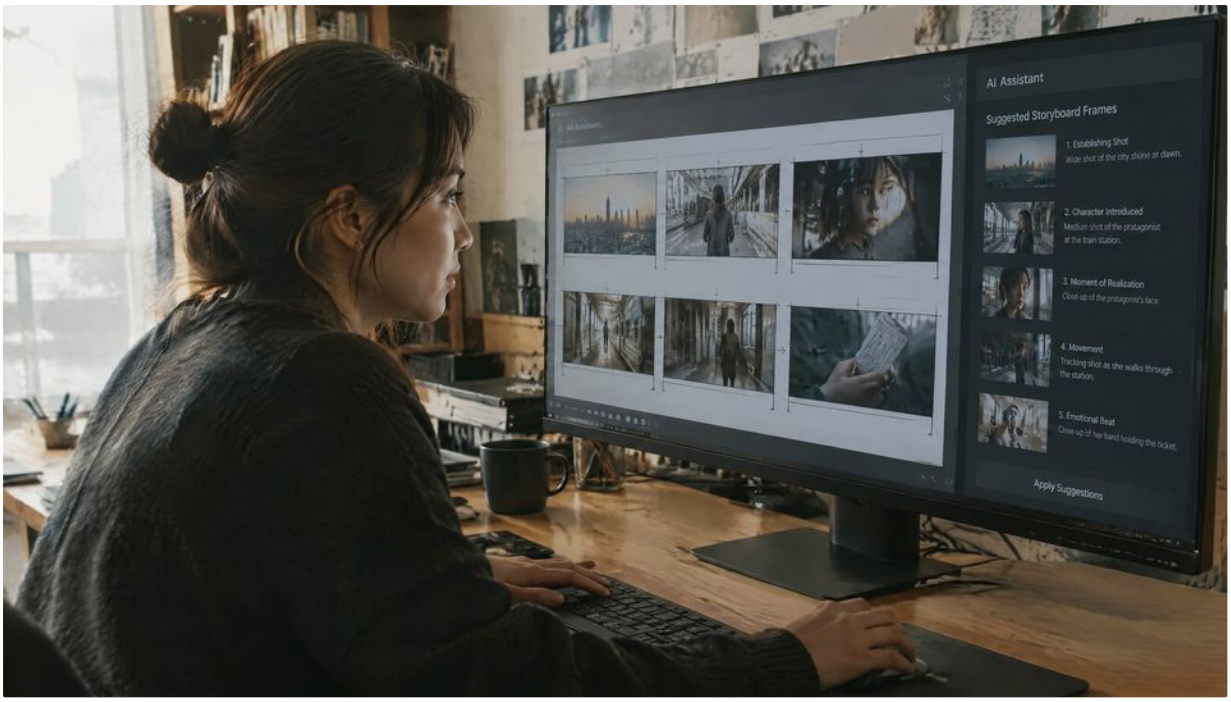
Exercise 11.2

Task	Chart the production of one short ad in both the traditional and the AI iterative structure, and mark where the bottlenecks form in each. Set your own stop criteria and locked zones and write them down.
Tip	Boxes and arrows are all a flowchart needs. Be sure to draw the arrows that loop back.
Assessment	Are the two structures' bottlenecks placed differently? Are stop criteria written as numbers?
Model answer	A plan stating counts and criteria together, like 'round 1: generate 30, pick 3; round 2: up to 10 from the picks.'

PART 11 Practice and careers in the AI transition

11.3 Where in the process it is used

Which stages actually use it? Surveys show generative tools are used most not to make a piece from start to finish, but to turn what already exists into many versions.



Note AI-assisted work — the machine turns out many drafts; people choose and fix them

42%

#1 generative AI use in the IAB survey — versions by audience (visual style changes 38%, contextual fit 36%)

About 80 types

Ad formats Cheil Worldwide's in-house tool auto-generates from one asset. Over 90% saved per banner (company's own claim)

48.6%

2026 survey of US video producers — substantial generative AI use in VFX. Shooting · capture 13.3%, camera · lighting design 8.3%

Term

Ad multiplier — keeping a high-performing ad's cut structure and pacing while swapping only cast · wardrobe · location · props to mass-produce variants. Common for regional versions.

Where AI has moved in

- **Variants and localization** — audience versions, format variants, ad multipliers
- **VFX execution** — repetitive work such as rotoscoping, cleanup, plate prep, denoising, upscaling and texture generation
- **Planning and previz** — concept art, storyboards, previsualization. The stage that changed most as draft costs fell close to 0
- **Automated review** — one global food company auto-checks about 16 compliance items on its own platform

Where people still do the work

- **Shoot design** — tools cluster in post and have barely reached camera and lighting design. Why this book gave pages to lighting · lenses · composition
- **Brand assets** — exact logos and product shapes aren't guaranteed at generation. Even tool makers advise 'if accuracy matters, add it in post'
- **Strategy and judgment** — agencies rate their AI maturity as intermediate in media planning and creative direction, beginner in strategic planning and research analysis

> What AI does well is 'making many versions of what is already decided.' Deciding what that is remains a human job.
>
> 11.3 Where in the process it is used

Exercise
11.3

Task	Make one 15-second vertical ad, then adapt the same message into a 30-second horizontal and a 6-second square version. Note what you changed and what you locked in each.
Tip	Decide what to lock first. Usually that means the one-sentence message, the product shot and the logo's screen time.
Assessment	Do all three versions carry the same message? Are the criteria for varying and locking clear?
Model answer	One that places the turning point differently for each length and explains why.

PART 11 Practice and careers in the AI transition

11.4 People, digital doubles, consent

AI actors, digital doubles and the question of consent. Generative tools proved useful fastest with backgrounds and props; the area that stays hard longest is people. Because audiences have trained all their lives to read faces, people are a technical problem and a rights problem at once.

Note

Digital double — scan a real actor and record their movement. Consent and a usage-scope contract come first

Motion capture — from the studio down to one phone

Optical markers — studio · sports science

Dozens of infrared cameras + reflective markers. Millimeter precision; the standard in sports-science motion labs and big VFX. Needs space

Inertial suit — anywhere

An IMU sensor on every joint. No cameras, so it works outdoors · in tight spaces. Position drift needs correcting. Haptic suits (Teslasuit-type) do the reverse: they send "feeling" to the body

Markerless AI — cameras only

AI estimates the skeleton from footage shot on 1–2 phones. Cost near 0 and instant, but less precise. Enough for ads · short-form · previz

Facial — the face on its own

A head-rig camera or a phone depth camera (ARKit) records 52 expression values. Core to digital doubles · virtual humans

How to choose

- Precision → optical
- Any location → inertial
- Cost · speed → markerless
- Expressions → add facial
- Animation-tool link → FBX · retargeting (Mixamo-style auto-rigging)

Figure 105

Four ways to capture motion — optical markers · inertial suit · markerless AI · facial. The change of the 2020s: "what once took a studio now takes one phone."

Three approaches

Fully generated person

Someone who doesn't exist, made from scratch

- No likeness-rights issues, low cost
- Hard to keep one face across cuts
- Weak at subtle facial acting

Digital double

A scanned copy of a real actor

- Dangerous scenes, age changes, fixes without reshoots
- Actor consent and a usage-scope contract are a must

Live action + partial generation

Shoot the people, generate only backgrounds · props

- The most widely used on ad sets today
- Safest on both quality and rights

TIP

The best reference image is a single front view with flat lighting and a neutral expression. The more distinctive features, the harder they are to hold.

Keeping the same face

A face that changes from cut to cut is the most common failure. In practice, you make the reference first and match everything else to it.

01

Reference image

Lock one front view first

02

Reference input

Feed the reference into every later generation; prompt only the angle · lighting · pose

03

Character sheet

Front · profile · three-quarter · full body on one sheet, like an animation model sheet

04

Fix in post

Close the remaining gaps with compositing and color correction. Don't expect 100% from generation

Rights: four things to check first

01 Likeness — using a real person's face · voice · signature gestures requires their consent. Creating a look-alike can also be a problem.

02 Scope — specify media · term · territory · extent of edits. 'Consent to be filmed' and 'consent to AI training and generation' are separate items.

03 Disclosure — when a generated person is shown as if real, it is safest to label it so no one is misled.

04 Records — keep the model used, the prompts, and the sources of reference images. Disputes usually escalate when there are no records.

> Shoot for real any cut that needs a human face in close-up. Spending the time generation saved you right there is the best deal you will make.
>
> 11.4 People, digital doubles, consent

Exercise 11.4

Task	Design a short 4-cut scene featuring one person. Make one reference image, then generate the other 3 cuts with it as reference input. Find what changed in each cut and log it in a table.
Tip	Make the reference image with flat lighting, a neutral expression and simple clothes.
Assessment	Do the four cuts read as the same person? Were the differences identified specifically?
Model answer	A report that logs differences by eyes · hairline · neckline and says how each will be matched in post-production.

PART 11 Practice and careers in the AI transition

11.5 Sets, LED walls, generated backgrounds

From sets to LED walls, and on to generated backgrounds. In 100 years the way backgrounds are made has changed three times: build it or go there, put an image up behind, or composite it in post-production. Generative tools have sharply cut the cost of the third and changed how material for the second is made.

Note

Small LED wall — the principle behind big virtual production has come down to one-camera studios

Four options and how to choose

Method	Strengths	Weaknesses	When to choose
Real location	The most convincing light and texture	Weather · permits · travel costs	When the brand is selling authenticity
Built set	Total control	Cost and build time	Repeat shoots, series
LED wall (virtual production)	Final image checked on set; reflections really land	Gear · pre-production costs, moiré	Subjects where reflections matter: cars · glass · metal
Chroma key + generated background	Cheapest and fastest	Edges and light matching are hard	People-centered, tight budget

TIP

The right order: settle the background before the shoot, then set the lights to match its direction. Locked-off shots suit generated backgrounds best.

Four places a generated background gives itself away

Light direction

Light on the person, shadows in the background

- If they disagree, it shows at once

Color temperature

A daylight-lit person on an evening background

- Looks off even with a clean composite

Perspective and lens

Vanishing point and angle of view

- Put a telephoto-compressed background behind a wide-angle person and the space breaks

Movement

Camera parallax

- When the camera moves, the background must move with matching parallax

Bringing in a whole space

Shooting a real space in many photos or clips, rebuilding it as 3D data, then moving the camera freely inside it has entered everyday practice. Photogrammetry has been joined by methods that learn and reproduce even the brightness of light rays, so subjects that were hard to rebuild, like glass · metal · foliage, are now workable. Shoot a store for half a day and every later ad can be shot in that space: the shoot itself becomes an asset.

> Saying you will decide the background later means saying you will decide the lighting later. The background comes first.
>
> 11.5 Sets, LED walls, generated backgrounds

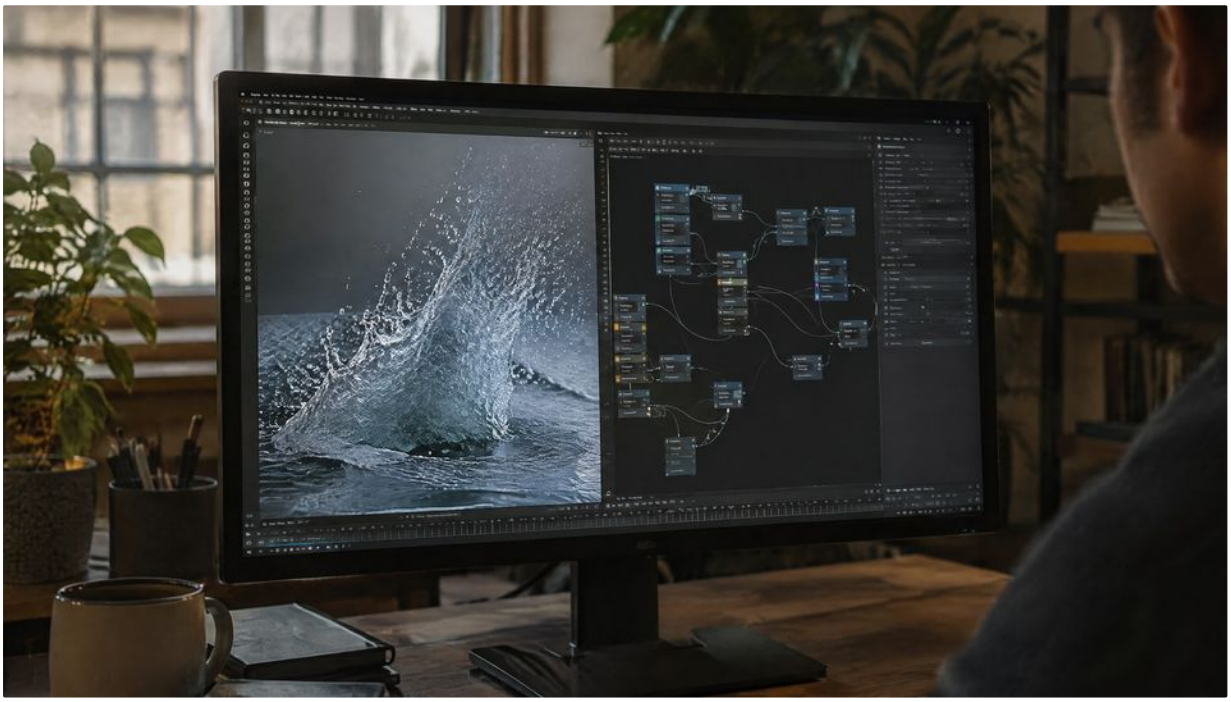
Exercise 11.5

Task	Take one cut of a person and swap the background three ways: shooting on a real location, chroma key + generated background, and photo compositing. Compare light direction and color temperature across the three in a table.
Tip	When shooting the person, capture one take with a gray ball and a white ball in frame. Matching light direction and color temperature gets much easier.
Assessment	Are the differences among the three explained in the language of light? Is there a reason given for which method suits this scene?
Model answer	A case that picked the background first, lit to match its light, then shot, so the composite needed almost no correction.

PART 11 Practice and careers in the AI transition

11.6 Elements and particles

Why is simulation still here? Generative models are good at 'motion they have seen often,' but water pouring, cloth draping and smoke curling along a wall are still unstable. These are the results of physical laws, and a generative model does not calculate laws; it makes pictures that look similar.



Note Simulation — change one variable and recalculate; the same settings give the same result

How the two differ

Aspect	Simulation	Generative model
How it works	Solves physics equations	Generates look-alike images from learned patterns
Repeatability	Same settings, same result	Different every time
Revisions	Change one variable, recalculate	Regenerate everything
Product fidelity	Keeps the real product's exact shape	Shape drifts little by little
Time	Long setup, long compute	Tens of seconds to minutes
Good at	Liquids · cloth · debris · collisions	Atmosphere, smoke, dust, background elements

Note

Brand assets may not be distorted. In a cut of a drink being poured into a glass, if the label warps for even one frame, the cut is unusable.

When ads especially need simulation

— **When the product is the hero** — no distortion of label or shape is allowed.

— **Repeat delivery** — when one scene ships in versions for many countries, a different result every time means no control.

— **Exact timing** — a request like a droplet landing at 0.4 seconds to hit the music can only be met by calculation.

Realistic ways to mix

Split into layers

Calculate the product, generate the background

- Simulate the product and key physics
- Generate background dust · haze · light bloom and composite it

Generated output as elements

Don't hand over the whole frame

- Render generated smoke or fire as element footage for compositing

Generate the concept, calculate the final

Separate the pitch from the final

- Pitch drafts fast, by generation
- After approval, redo the final as a simulation

> If a brand logo or the product's shape is on screen, don't leave that part to generation. The rest you can.
>
> 11.6 Elements and particles

Exercise 11.6

Task	Make a 3-second cut of water being poured into a cup in two ways and compare them: one shot for real or simulated, one generated. Rate label distortion, timing accuracy and repeatability in a table.
Tip	For the generated version, run the same prompt five times. The difference in repeatability shows right away.
Assessment	Are the criteria recorded as numbers or observations? Is there a conclusion on which method suits which situation?
Model answer	A comparison image setting the five generated results side by side, with label distortion marked.

11.7 Traditional production and AI production

What goes where? The two are not rivals but tools for different jobs. On set the question is not 'which is better' but 'which fits this cut.'

Criterion	Traditional favored	AI favored
Product shown large on screen	Shape and logo stay intact	Risk of distortion
Same result needed repeatedly	Same settings, same result	Changes every time
Comparing many drafts	Days per frame	Dozens in 30 minutes
Very small budget	High minimum cost	Drafts cost almost 0
Real people · places	Captured as they are	Rights and accuracy issues
Exact motion of water · fire · cloth	Controlled by calculation	Systematically unstable
Atmosphere · far backgrounds · particles	Costs time and money	Fast and cheap
Versions for many countries · formats	Rework for every version	Strong at variant production
Shot design · lighting	Core skill	Has barely made inroads

One piece of evidence on physics

29.5 /100

Score of the best video-generation model on a physics-understanding benchmark published in 2026 (real footage = 100). How realistic a clip looked had no meaningful correlation with its physics score

Spotlight

Recent research on improving fluid behavior trains on ground-truth data made with existing simulation software. Simulation is not being replaced; it has moved upstream of the generative model.

The researchers' conclusion is simple. Looking plausible does not mean understanding physics.

Mixing is the default

01 **Split the layers** — shoot or simulate the product and key physics, generate background atmosphere and particles, and unify compositing and color in post-production.

02 **Separate pitch from final** — generate pitch drafts fast; after approval, remake the final with a method you can control.

03 **Settle disclosure early** — before delivery, list which stages used generative tools. Platforms and clients ask for it.

> If brand assets are on screen, control that layer. The rest can go to generation.
>
> 11.7 Traditional production and AI production

Five things for working with AI — what goes in, what gets checked

① Start characters with a turnaround

First make front · ¾ · side · back on one sheet. Only with this sheet fed in as reference does the same person appear in every later cut

② Face consistency — reference + identifiers + seed

Feed in the same reference image every time and repeat the identifiers in the prompt (bob cut · mole under the left eye · mint jacket). Change only the scene

③ Prompt skeleton — fill seven slots

Subject
Korean barista in their 30s

Action
pours latte art into a white cup

Place
inside a small sunlit cafe

Light
warm morning side light from a window

Lens
50mm f/2, shallow depth of field

Style
editorial documentary, muted film color

Exclude
text · logos · 6 fingers

The photo at left is this exact prompt's result. "50mm f/2" works better than "make it pretty"

Where things stand in 2026

Still images · drafts	■■■■■	Essentially there — ad drafts · mood boards are already standard practice
5–10 s video clips	■■■■□	B-roll · backgrounds · transitions usable — hands · text · fast action not yet
Character consistency	■■■□□	Reference + seed holds the face; clothes · props often change
Lip sync · dialogue	■■■□□	One person facing front works; profiles · groups look off
Physics of water · fire · cloth	■■□□□	Plausible but wrong — physics benchmark 29.5/100
Narratives of 5 minutes or mor	■□□□□	Continuity breaks between cuts — people stitch it together in the edit

Where it pays off most

- Planning — dozens of mood boards · storyboard drafts in an hour
- Unshootable inserts — space · undersea · the past · dangerous scenes
- Format variants — horizontal → vertical · square · multilingual versions
- Post-production — roto · cleanup · background extension · subtitle drafts

Watch out for

- Rights — no copying real people · logos · a specific work's style
- Disclosure — if generated material is used, say so in the credits
- Review — check fingers · text · shadow direction · reflections in every cut
- Keep originals — log prompt · seed · model version, or it can't be reproduced

Figure 106 Bringing AI into practice — turnarounds, face consistency, the prompt skeleton, and where things stand in 2026. Treat it not as a "replacement" but as "a new hire you hand one stage to" — give specific instructions, and always review the results.

Exercise 11.7

Task Imagine an ad you might be hired for and make a table deciding, cut by cut, between traditional and AI production. Give each decision a one-line reason.

Tip For hard calls, give an answer split by stage, such as 'generate the draft, shoot the final.'

Assessment Are the criteria applied consistently? Are the cuts with brand assets classified correctly?

Model answer A report that made the same cut both ways and compared the actual measured cost and time.

PART 11 Practice and careers in the AI transition

11.8 The changing Korean job market

How is the Korean job market changing? Official statistics point less to 'jobs as a whole are vanishing' than to 'the entrance young people used is narrowing.' Let's look at the numbers as they are.

−285,000 people

Bank of Korea analysis — drop in employed 15–29-year-olds, 2022.6–2026.6. 94% of it in highly AI-exposed industries; those in their 50s rose over the same period

−31.4%

Young workers in the same analysis — ICT. Publishing (incl. software · web design) −27.4%, computer programming −16.6%

65.6%

FKI survey, ages 19–34 — worry that 'AI will shrink entry-level work and the chance to grow into skilled staff'

These numbers all point to one thing. What is disappearing is not the profession but the bottom rungs of the ladder. The path of starting out as an assistant editor or assistant designer is narrowing.

Spotlight

The Korea Employment Information Service's 2025–2035 outlook put 'design · editing assistant jobs' among those hit hardest by automation, and saw rising demand for comic · webtoon artists and film · music producers.

Note Entry-level hiring — what is shrinking is not the profession but the bottom rungs of the ladder

What job postings show

AI became a requirement

Not a plus but a must

- Late-2026 video · content designer postings listing 'experience making assets with AI video · image generation tools' as required

Tool names go unlisted

Your output is the proof

- Broad wording such as 'generative AI (image · video generation tools, etc.)'
- Output over certificates in specific tools

Bundled into one person

Production + planning + reading results

- Running generative tools, joining pre-production meetings, building brand video templates and reading click-through · conversion rates, all in one posting

New job titles are still rare

AI requirements inside existing roles

- No confirmed posting with 'AI video director' as its actual job title
- Public training programs named 'AI content orchestrator' and 'AI media creator'

Generations, experience, process — what the film The Intern shows

Note An office where generations mix — the young are faster with tools; the old have the experience of seeing a process through

A 70-year-old intern and a 30-year-old founder

Nancy Meyers's The Intern (2015) tells of a retired 70-year-old man who joins an online fashion startup as a senior intern and works beside its young founder. What he brings is not the latest tools but the experience of having seen how a company runs from start to finish: a feel for process. The Korean remake, directed by Kim Do-young and starring Choi Min-sik · Han So-hee, opened on September 16, 2026. It pairs a senior intern who has finished 37 years of office life with the head of a fashion startup in its 3rd year, moving the frame of an exchange between generations and experience into the Korean workplace. In a market where the entrance for newcomers has narrowed, there is one way to watch this film. Speed with tools is soon matched, but someone who knows the whole process is useful in any seat.

Four ways to survive a market with fewer entry-level jobs

Fewer scheduled open recruitments and more rolling · experienced hiring: this is not a video-industry trend alone. As more postings look for 'newcomers with experience,' work you have seen through to the end for a real purpose becomes your ticket in. On that premise, I recommend four things.

Split the stages

Stages AI replaces, stages that remain

- Replaced — format variants, roto · cleanup, first drafts, simple subtitles
- Remaining — shot design and lighting, brand-asset control, the judgment of what to make

Process

The value of knowing the whole

- Anyone who has gone from planning to delivery · invoicing even once reads what comes before and after, whatever stage they join
- This is exactly what the hero of The Intern has

Accumulation

Stack up many small finished works

- Ten finished 15-second pieces beat one unfinished epic
- Videos with a real purpose, for a local shop or a department event, are your track record

Paths

Founding solo or as a team

- With gear and generative tools cheaper, one person can handle planning · production · delivery
- Two or three classmates splitting roles to start a small studio is also a realistic option

The industry backdrop

6.8 → 13.2 → 32.1%

Generative AI use at content companies, 2023→2024→2025 (KOCCA). Advertising: 40.9%

22.1%

Among 2024 reasons for not adopting it: 'hard to hire capable new staff.' An opening left for newcomers

1,116.4 → 310.4bn won

Terrestrial TV ad spend, 2011 → first half of 2026. The main cause of pressure on outsourcing rates is not AI but shrinking ad budgets

> What is shrinking is not the profession but the entrance. When the entrance narrows, get in with 'the one thing others can't do.'
>
> 11.8 The changing Korean job market

What shrinks is not the profession but the ladder's bottom rungs

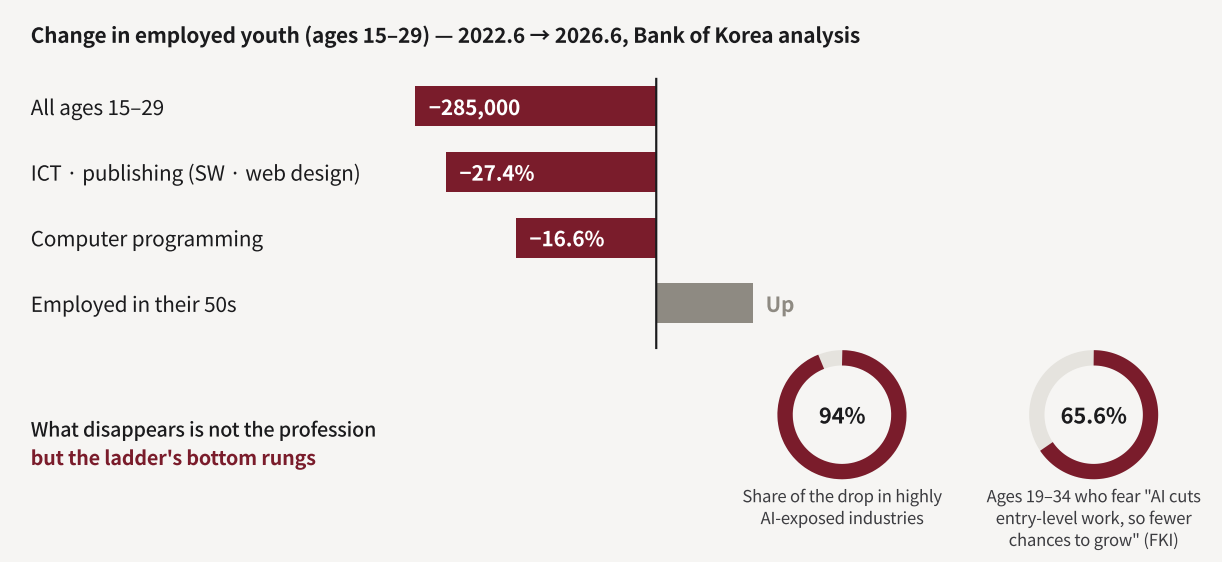


Figure 107 The narrowing entrance in numbers — the drop in young workers was concentrated in highly AI-exposed industries, while those in their 50s rose over the same period. The text's figures on one page (sources in the text; 2026 estimates · survey figures).

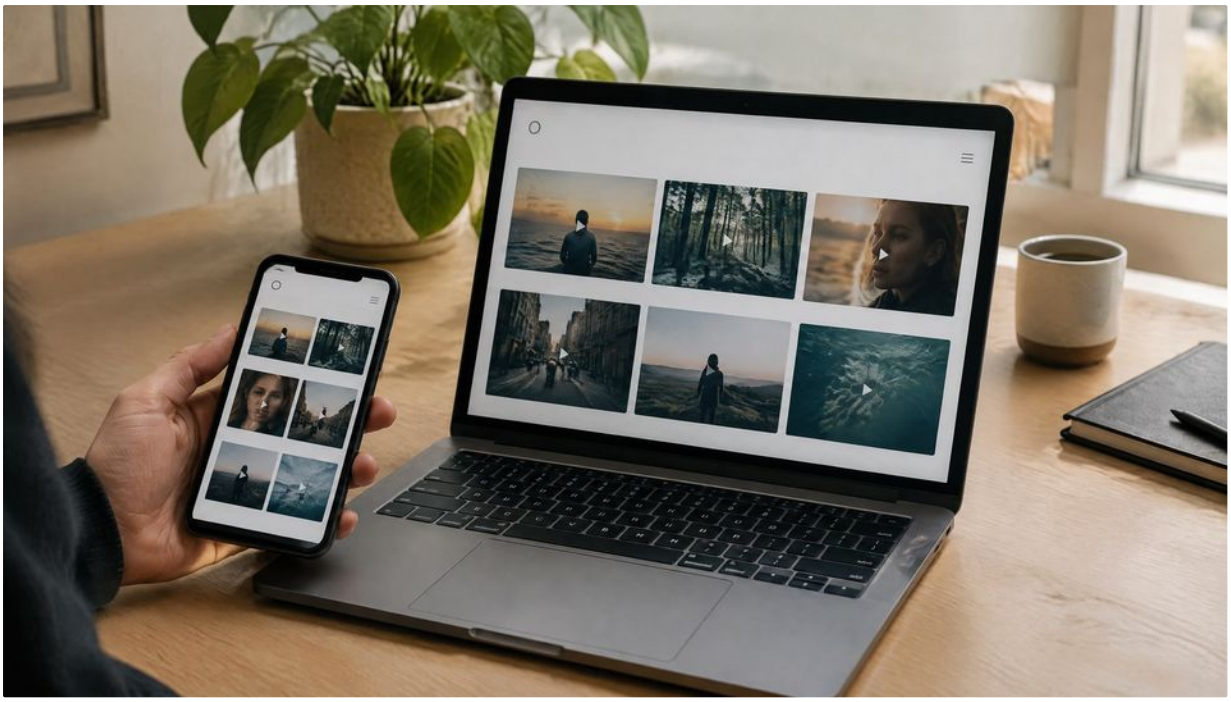
Exercise 11.8

Task	Collect 10 postings for a job you want and tabulate the skills they ask for. Mark whether you have work that proves each one now, and turn the gaps into next semester's plan.
Tip	Collect postings under the same job title but mix company sizes. You will see the range of expectations.
Assessment	Are the required skills copied in the postings' own words? Do the gaps lead to concrete plans?
Model answer	A summary that flagged the items common to 7 or more of the 10 postings and set priorities from them.

PART 11 Practice and careers in the AI transition

11.9 How portfolio platforms are changing

How have the platforms changed? As of 2026 each platform asks for a different level of AI disclosure; some penalize violations, others only recommend. What students need is the baseline for 'how much must I disclose.'



Note

Portfolio platforms — wherever you post, keep one baseline for AI disclosure and your level of involvement

Platform	AI work	Disclosure required	Penalties
Vimeo	Allowed	Realistic content must be disclosed	Unremovable label; repeat offenses end the account
YouTube	Allowed	Realistic composites must be disclosed	Auto label, no monetization
ArtStation	Allowed	Tag required on products for sale	Marketplace rules
Behance	Allowed	Recommended only, not required	None
Instagram · TikTok	Allowed	Realistic content must be disclosed	Auto label; penalties for repeats

Changes at ArtStation

No AI training by default

From September 2026

- Applies retroactively to new · existing uploads and profiles
- Artists must opt in themselves to allow training

Crawler blocking

At the bulk-access level

- Blocks known AI crawlers and automated scraping
- Regular search indexing stays

Labeling tools are unfinished

Rules may change further

- The platform itself admits 'current AI labels and filters are not enough' and has promised improvements

TIP

Behance's hiring feature does not let you attach a résumé or cover letter. Your project page must be both portfolio and résumé, so put your role · process · decisions inside it.

Weaknesses recruiters point out

In ArtStation's 2026 survey, two of the six applicant weaknesses recruiters saw most were about presentation, not skill: 'poor presentation and navigation' and 'an unclear personal role in team projects.' Stating your scope of involvement was always a basic requirement; AI disclosure extends it.

The fatal line is not AI

At Cannes Lions 2025, an agency returned three awards, including a Grand Prix. The problem was not that it used AI but that it used video mimicking real news reports to misrepresent its results. Cannes then changed its rules to require declaring all AI use in production. Inflating results is far more dangerous than using AI.

> Label the work once, to the strictest rules it will face, and keep the label identical on every channel.
>
> 11.9 How portfolio platforms are changing

Exercise 11.9

Task	Pick one of your works made with generative tools. Assuming you will post it on Behance · ArtStation · YouTube, write a disclosure line and a description for each.
Tip	Write disclosures by stage. The more specific, like 'background generated with AI; compositing and color correction by me,' the more trust you earn.
Assessment	Are the differences in each platform's rules reflected? Is the level of involvement stated without exaggeration?
Model answer	A case that unified one work's disclosure across the three platforms while meeting every platform's rules.

11.10 Overseas markets and LinkedIn

What overseas postings show. Overseas data comes with many published numbers, which makes trends easy to read. It does not transfer directly to Korea, though, so use it to read direction.

What postings ask for has changed

A 2026 report analyzing over 500 AI video job postings found prompt-writing skill in only one in five, and then only as a one-line item. What rose instead were these three.

17 → 41%
Film-grammar terms such as shot · framing · lens · composition

21 → 35%
Demand for character and visual consistency

6 → 16%
Ability to lead a team

- **Titles** — 57% add AI to an existing job title. Broad titles like 'AI artist' fell from 36% to 25%; 'filmmaker · director' rose from 7.7% to 16.1%.
- **Employment type** — 51% contract · freelance · per project; 28% full-time. Winning jobs · quoting · contracting now matter as much as the portfolio.

Note

'Demand for AI video rose 329%' and 'AI video rates went up' are entirely different claims. The figure is demand and search volume, not rates.

AI skill itself is not scarce

85% of postings

Do not specify AI skills

- US creative professional postings as of April 2026
- Postings requiring AI rose only from 10% to 15%

No new jobs emerged

Existing roles + AI requirements

- Roles in AI-requiring postings: graphic designer 11%, video editor 10%, etc.

Three times the competition

Postings up 8%, the pool 3 times larger

- About 12 million US adults are preparing to enter creative jobs, roughly 3 times current workers and majors combined
- 77% of them see generative AI as central to their careers

Why shot design is the line of defense

US video makers' generative AI use is concentrated in VFX at 48.6%, with only 13.3% in shooting · capture and 8.3% in camera · lighting design. The World Economic Forum ranks graphic design among the top declining jobs and UI · UX design among the top growing ones. Even within 'design,' the side that involves judgment and planning is what remains.

The freelance market

+329%

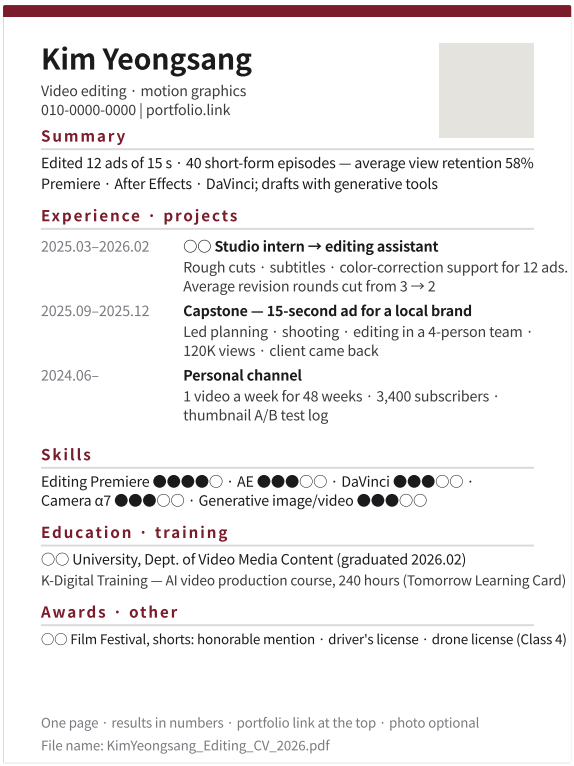
Upwork 2026 demand data — the fastest-growing design · creative skill: 'AI video generation · editing.' Traditional video editing · production demand also stays near the top

12,000 requests

9 months of cumulative requests in Kmong's AI services category (launched 2025.6). AI video leads at 26%, with short-form production the most requested

> What overseas postings asked for more was not prompts but film grammar, consistency and leadership. That is your learning order.
>
> 11.10 Overseas markets and LinkedIn

Where to post, where to look, how to learn



Kim Yeongsang

Video editing · motion graphics
010-0000-0000 | portfolio.link

Summary

Edited 12 ads of 15 s · 40 short-form episodes — average view retention 58%
Premiere · After Effects · DaVinci; drafts with generative tools

Experience · projects

2025.03–2026.02 — ○○ **Studio intern → editing assistant**
Rough cuts · subtitles · color-correction support for 12 ads.
Average revision rounds cut from 3 → 2

2025.09–2025.12 — **Capstone — 15-second ad for a local brand**
Led planning · shooting · editing in a 4-person team · 120K views · client came back

2024.06– — **Personal channel**
1 video a week for 48 weeks · 3,400 subscribers · thumbnail A/B test log

Skills

Editing Premiere ●●●●○ · AE ●●●○○ · DaVinci ●●●○○ · Camera α7 ●●●○○ · Generative image/video ●●●○○

Education · training

○○ University, Dept. of Video Media Content (graduated 2026.02)
K-Digital Training — AI video production course, 240 hours (Tomorrow Learning Card)

Awards · other

○○ Film Festival, shorts: honorable mention · driver's license · drone license (Class 4)

One page · results in numbers · portfolio link at the top · photo optional
File name: KimYeongsang_Editing_CV_2026.pdf

One-page CV sample — editing role
Top to bottom: contact and links → 3-line summary → experience (dates · role · numbers) → skills → education → other. Change the summary and order for each job you apply for

Work24 (merged Worknet · HRD-Net)
Ministry of Employment and Labor — job postings + vocational training + unemployment benefits + Tomorrow Learning Card applications in one place

JobKorea · Saramin
The most open-recruitment · SME postings. Register a résumé and offers come to you

Wanted · Remember
Startup · experienced · referral hiring. Search video · motion · content by job tag

Filmmakers · Kmong · Soomgo
Video crew jobs · freelance gigs — first set experience and a feel for quoting

LinkedIn
Overseas · foreign firms · global agencies. One-line English summary + showreel link + recommendations

National Tomorrow Learning Card
KRW 3 million (up to 5 million) in training costs over 5 years — issued via Work24; K-Digital Training fully covered

LinkedIn profile — five fields

- Headline: role + strength in one line (e.g. Video Editor · 15s ads · motion graphics)
- About: 3 sentences — what you make, what numbers you hit, what you're looking for
- Featured: pin the showreel link at the top
- Experience: by project, results in numbers
- Recommendations: 2 people you've worked with — a professor · an internship mentor

Check before applying

- Tool names under 'preferred' in the posting: spell them the same in your résumé's skills section
- Submitted file name: name · role · date
- Check on your phone that the portfolio link opens without a login

Figure 108 — Korean job channels and documents — a one-page CV, LinkedIn, and Work24 · JobKorea · Saramin · Wanted · Filmmakers. Cover training costs with the National Tomorrow Learning Card — get it before graduating and you can take fully funded courses such as K-Digital Training.

Exercise
11.10

Task	Find 5 overseas job postings and sort the required skills into five branches: film grammar, tools, consistency control, collaboration and reading results. Compare them with 5 Korean postings and note the differences.
Tip	Look at the LinkedIn and ArtStation job boards together. The same role is worded differently.
Assessment	Is the five-branch sorting applied consistently? Are the differences between Korea and overseas pinned down specifically?
Model answer	A comparison that set the broad wording of Korean postings beside the specific wording of overseas ones and concluded what the portfolio needs to show more of.

PART 11 Practice and careers in the AI transition

11.11 Student vision and expertise

What vision and expertise should students have? There is no answer to 'what should I learn to be safe.' Knowing how to operate a tool goes stale in 2–3 years at most. The better question is 'what abilities hold their value whatever changes.'

Generative tools produce averagely plausible results very fast. So the value of average output quickly converges to 0, and what rises in value is judgment that departs from the average: the ability to explain 'why it has to be this.'

Note Starting up — when the entrance narrows, becoming your own client is also a career path

Four things that hold their value

Problem definition

Translate symptoms into causes

- Turn 'make us a video' into 'we need more first visits from new customers'

Grounds for judgment

Why this one out of ten

- Ten drafts take a few minutes
- Whoever can say why they chose becomes the one in charge

Feel for the real

An eye for the lies in generated images

- Cuts with mismatched shadow directions, cuts whose depth of field can't be explained
- Only people who have set lights and swapped lenses catch them

Language skills

Proposals · director's notes · feedback · prompts

- Writing the picture in your head so people and machines understand it the same way is productivity itself

Term

Broom-shaped — the T-shape (deep in one thing, understanding adjacent fields) with a wider crossbar. Think of an editor who also handles motion graphics · sound cleanup · thumbnails, or a DP who

The shape of expertise: from T to broom

As AI tools lower the barriers to adjacent fields, the broom shape with its wider crossbar has become the realistic model. But a wider crossbar does not make the vertical stroke unnecessary. Someone who does everything passably ends up competing with tools that do everything passably. Pick one field you can answer for, and be able to show its depth as evidence.

also proposes a rough cut and color-correction standards.

What was required before AI

- Tools — skill in specific software
- Work — executing assigned cuts accurately
- Speed — working fast alone
- Evidence — finished output
- Collaboration — communicating within your stage

What is required now

- Tools — how fast you switch tools and why you choose them
- Work — proposing what to make and owning it
- Speed — quickly comparing · selecting many drafts
- Evidence — output + the process of choosing
- Collaboration — reading the whole pipeline, requesting · coordinating

> Before you put a tool's name on your résumé, write one sentence about a judgment you made with it. If you can't, it isn't yours yet.
>
> 11.11 Student vision and expertise

Exercise
11.11

Task	Choose one field you will answer for and pick 3 works that show judgments you made in it. For each, write two sentences on 'what I chose and what I dropped.'
Tip	Name the field like a job title. The narrower the better: not 'good at video' but 'interview lighting' or 'short-form retention editing.'
Assessment	Are the choices and trade-offs written specifically? Is it a record of judgment rather than a boast about results?
Model answer	Writing that pairs a constraint with a response, such as 'No budget, so I used only natural light, but I fixed the shooting time at 4 p.m. to keep the shadow direction consistent.'

Ten rules for surviving your first job — what shows before skill

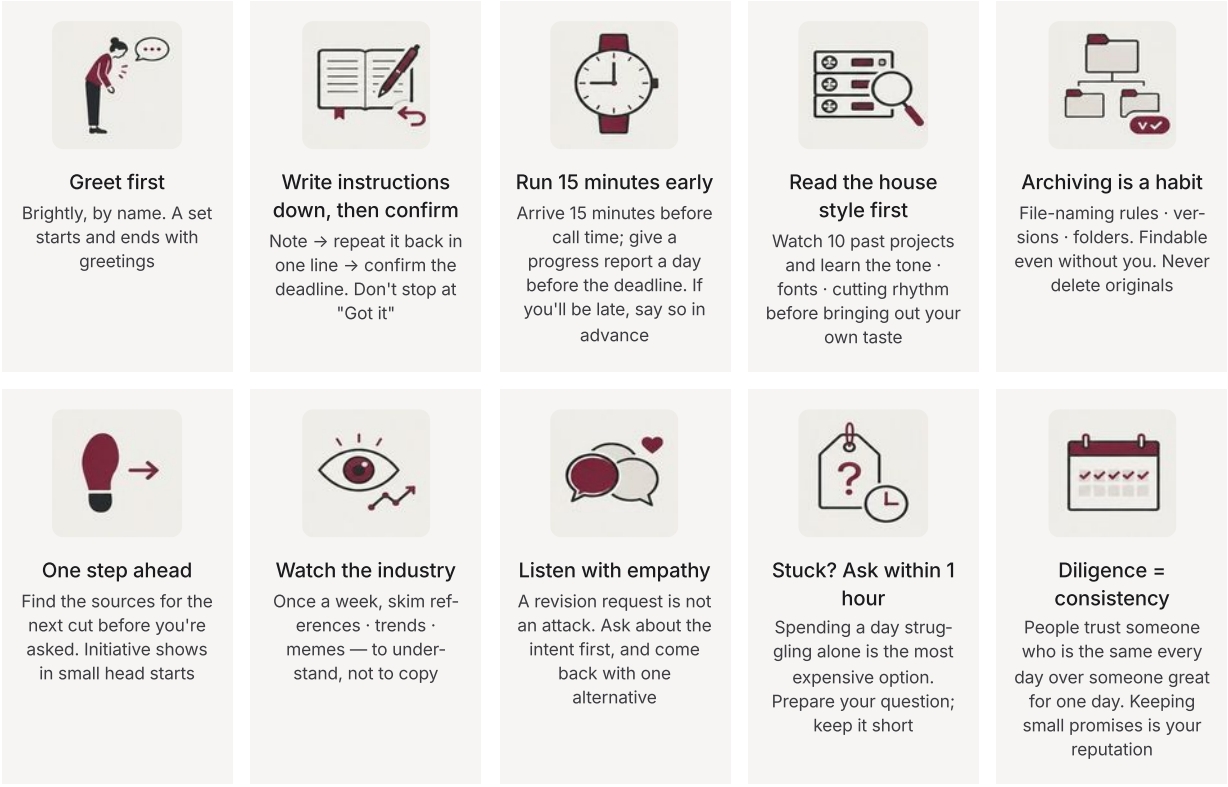


Figure 109 Ten things that work in your first job — what shows before skill. Video crews are small teams, so attitude is reputation, and reputation brings the next job.

To you, heading out into the world

Don't be afraid. You have already done plenty.

If you have read this far, you have drawn storyboards, set up lights, polished cuts until dawn, and presented work you weren't happy with. All of that is experience. If the speed of change feels frightening, it means you are seeing that change clearly. Those who can't see it aren't afraid either.

Your first job is not your final identity. Your first piece is not your signature work. Tools keep changing, but the eye that chooses what to show and what to hide, the discipline of keeping the times you promise people, and the strength to finish do not. You have already practiced all three in this class.

No one goes out fully prepared. You get prepared by going out. Start small, finish it, and show it. Even if you're turned down, the work remains. The work that remains opens the next door.

— Waiting for your first showreel

PART 11 Practice and careers in the AI transition

11.12 Key message and copy

Where does the emotional punch come from? After a good ad, what people remember is not the image but one sentence. The more easily generative tools make images, the more a work's level depends on whether it has a sentence to drive home.

A key message is a choice, not a summary

A key message means dropping nine of the ten things you could say and keeping just one. If dropping them hurts, it isn't decided yet. Test it three ways.

01 **One-sentence rule** — it must finish as one sentence with no conjunctions. If 'and' or 'also' creeps in, you are saying two things.

02 **The opposite test** — Nobody ever says the opposite of 'We care about our customers.' A sentence with no possible opposite is not a message.

03 **The subject swap** — If the line still works with a competitor's name in place of the brand's, it belongs to no one.

TIP

In a 15-second ad, the turn usually comes at 8–10 seconds. It takes nerve not to fill the last second with explanation.

What moves us

Being moved doesn't come from explaining emotion; it comes when the audience notices on their own. Instead of naming grief, you show the empty chair left at the table.

Specifics

Numbers, things, time

- Not 'many people' but 'a 3-shift worker at six a.m., just off duty'

Turn

Where expectation breaks once

- The story's 'turn'
- In a 15-second ad, at 8–10 seconds

Space

Room left for the audience to fill

- Leave the conclusion unsaid

Five steps to writing copy

01	02	03	04	05
Gather facts	**Pick one person**	**Choose what to say**	**30 sentences**	**Read aloud**
20 verified facts only, no adjectives	One sentence on what is bothering one specific person right now	Of the 20, the one that matters only to that person	Say it 30 ways. The first five usually get tossed	A line that doesn't roll off the tongue won't be remembered

Typical copy	What's wrong	Rewritten
We promise the highest quality	Fails the opposite test	Same factory, same people, 7 years running
Growing with our customers	Fails the subject swap	Our first client is still our client
Innovative tech, new experiences	Not a single specific	One button is gone
We'll change your everyday life	The brand is the hero, not the audience	20 minutes home, and your hands are free

> When the copy won't come, delete every adjective. The nouns and verbs left are what you really have to say.
>
> 11.12 Key message and copy

Exercise
11.12

Task
Pick an object you use often and write a one-sentence key message and five lines of copy for a 15-second ad. Choose one and draw it as a 6-cut, 15-second storyboard.

Tip
Start by listing 20 facts. If you can't write them without adjectives, you don't know the object yet.

Assessment
Does the message pass the opposite test and the subject swap? Is the storyboard's turn clear?

Model answer
A storyboard that delivered the message through one moment of the user, never naming a product feature.

PART 11 Practice and careers in the AI transition

11.13 The at-a-glance proposal

The power of planning comes from a document that gets read. Most student proposals are either pretty but unclear about what they propose, or full of content but unreadable. Reviewers and clients don't spend 3 minutes on one.

Note Knowing the process — planning is not about ideas but about setting scope within the whole flow

> **One-line definition**
>
> This video makes [whom] feel [what] so that they [take what action]. If you can't fill in this sentence, it isn't a plan yet.

Planning starts by narrowing

The essence of planning is not generating ideas but setting scope. Write down the three constraints of budget, schedule and crew before you start, and the ideas actually get better.

— **A not-to-do list** — Spell out the subjects you won't cover, the techniques you won't use and the information you won't include. Without it, revision requests multiply endlessly.

— **Success criteria** — Write them as results, not completion. They must be checkable numbers: not 'views' but '40% watched to the end.'

TIP

State the conclusion on the first page and add evidence as you go. It is a proposal, not a report.

Structure of an at-a-glance proposal

Page	Contents	Length	Why it fails
Cover	One-line title and one-line definition	1 page	A title but no definition
Problem	What is wrong right now	1 page	Describes the company, not the problem
Solution	So what will you make	1 page	Lists several options and asks them to pick
Tone	3–6 reference images	1–2 pages	Pretty pictures, no reasons
Flow	Storyboard or flowchart	1–2 pages	Tries to draw every cut and loses focus
Execution	Schedule, crew, budget	1 page	No numbers, or no basis for them
Results	How success will be measured	1 page	Left out entirely

Five ways to make it read at a glance

01 One page, one message — The title is the conclusion. 'Market analysis' fails; 'Men in their 20s drop off in the first 3 seconds' succeeds.

02 One big number — Make only the most important number big; keep the rest small.

03 Show by comparison — Current vs. proposed, competitor vs. us, before and after. A comparison conveys the difference without explanation.

04 Design the eye path — Pages read from top left to bottom right. Put the most important thing at top left.

05 Don't write what you'll say — The slide is the evidence; your voice does the persuading.

> When the proposal is done, read only the page titles in a row. If they tell the story on their own, it passes.
>
> 11.13 The at-a-glance proposal

Exercise 11.13

Task	Pick one past project and write its proposal backward in the 7-page structure. Every page title must be a conclusion sentence.
Tip	Don't invent research or numbers you never actually had; mark them 'to be confirmed.' Knowing where the gaps are is the lesson.
Assessment	Do the titles alone tell the story? Does it have a not-to-do list and success criteria?
Model answer	A proposal that stated its constraints (500,000-won budget, 1-person crew) on page 1 and explained every choice within them consistently to the end.

PART 11 Practice and careers in the AI transition

11.14 Turning your work into a job

How to gather and organize your work and turn it into a job. A portfolio isn't made at the end of term; it builds up as you go. This section covers work habits that spare you the pre-graduation 'where did that file go?' and how to turn collected work into employment.

Habits to build as you go

Project folder rule

Date_ProjectName_Role

- Always 01_Planning 02_Shoot 03_Edit 04_Delivery 05_Records
- 05_Records holds set photos, lighting setup notes, revision history

Last-day 30 minutes

Write three things

- What you set out to do
- What blocked you
- How you solved it — in six months you won't remember

10 stills

Save key stills separately

- Used everywhere: portfolio, résumé, social media, slides

Keep originals

At least 2 years

- Revisions always come after you delete

TIP

Each time you add a new piece, drop your weakest one. Adding ordinary work lowers the average.

Choosing what to show

A portfolio is judged by impression, not by total. The rule is to reselect for each role you apply to; using one showreel for every role is wearing clothes that fit no one.

Role	Lead with	Section to show	Notes to add
Shooting	Designed light and framing	One long cut	Lighting diagram, gear and settings
Editing	Where rhythm and structure show	30 seconds packed with cuts	Before/after, dropped cuts and why
Motion	Where type and motion lock	10-second loop	Keyframe graphs, hours spent
Planning · AE	Campaigns with results in numbers	Full final cut	1-page proposal, KPIs
AI use	Work where human judgment shows	Generated vs. corrected	Prompts; how many tries it took

How to show work made with AI

Hiding the use of generative tools is no longer the safe choice. What matters is not whether you used them but where and how, and what a human decided.

— **State your share** — By process, as in 'background generated by AI, compositing and grading by me.' Exaggeration shows after one or two specific questions.

— **Record your choices** — Show the 1 image you picked from 20 generated, and why, and you prove your eye rather than the tool.

— **Check rights** — Confirm commercial-use terms and whether real people or brands appear; if there's a problem, keep it out of your public portfolio.

The path to a job

01	02	03	04
Before applying	**Application**	**Interview**	**Once hired**
Chart the skills the posting asks for and list your matching work. Empty cells are next term's homework	Portfolio link on page one. For each tool you name, one line on a judgment you made with it	Four sentences per project: 'intent-constraint-choice-result'	Your first 3 months test attitude. Deadlines, tidy files, ask early when unsure

> Each time you add a new piece, drop your weakest. The size stays the same, but the average keeps rising.
>
> 11.14 Turning your work into a job

Exercise
11.14

Task	Put all your work so far into a table, choose one role you want to apply for and pick 5 pieces. For each, write the four 'intent-constraint-choice-result' sentences and your share of the work.
Tip	Arrange your 5 pieces with the strongest first and the second strongest last.
Assessment	Does the work fit the role? Is your share stated accurately? Do the four sentences record judgments rather than boast of results?
Model answer	The same project edited two ways, for shooting and editing applications, changing the sections shown and the notes.

PART 11 wrap-up

One-page summary

11.1 How much production time has shrunk	Generation cost and time shrank; selection time didn't. Give figures with source and conditions.
11.2 How the pipeline was rebuilt	From linear to a generate↔select↔regenerate loop. Stop criteria · locked sections · version logs protect the schedule.
11.3 Where in the process it is actually used	Concentrated in variants · localization and VFX execution; shoot design, brand assets and strategy stay with people.

11.4 People: AI actors and digital doubles	Base image → reference input → character sheet → post-production fixes. Check likeness · scope · disclosure · records first.
11.5 Backgrounds: sets, LED walls, generated backgrounds	Choose among location · set · LED wall · chroma key+generation, but settle the background first, then light.
11.6 Elements and particles	Simulate the product and key physics; generate atmosphere and particles. Split into layers and composite.
11.7 Traditional production and AI production	Not rivals but tools for different jobs. Control the layers that carry brand assets; hand off the rest.
11.8 The Korean job market	What disappears is not jobs but the bottom rungs of the ladder. AI has become a requirement within existing roles.
11.9 Portfolio platforms	Label by process to the strictest rules and keep it the same on every channel. Inflating results is fatal.
11.10 Overseas markets and LinkedIn	What postings increasingly demand is not prompting but visual grammar · consistency · leadership. More demand doesn't mean higher rates.
11.11 Vision and expertise	Problem definition · reasoning · feel for the real · language skills keep their value. Be broom-shaped, but keep the vertical stroke.
11.12 Key message and copy	A message is a choice, not a summary. It passes the opposite test and the subject swap, and moves people through specifics · turn · space.
11.13 Planning and the proposal	One-line definition, not-to-do list, success criteria. In the 7-page structure, every page title must be a conclusion sentence.
11.14 Turning work into a job	Build with the folder rule and last-day 30 minutes, pick 5 pieces per role, explain each as 'intent-constraint-choice-result.'

What you make in this PART

1. A 1-second video from 12 consecutive photos
2. The Kuleshov effect in 3 versions
3. A pinhole camera and its inverted image

What is video?

The first wall a learner hits is not technique but information overload. Tools change every 10 years; the language of video has stood almost still for over 100. This PART looks to history for why 24 frames, and why faces grow as screens shrink, to build a basis for judgment that holds steady in front of any new tool.

Photo P-01 Film projector and reels — when video was a physical thing · generative image

Using this chapter in class

Explain why video took the form it has today

Materials 3 reference videos, timeline plate, projector

Intro	Concept	Plates	Exercise	Wrap-up
Watch the first 30 seconds of a favorite video together and count the cuts	Perception and the origin of frame rate. Where did the number 24 come from?	Pinpoint the media transitions on the timeline diagram	Make or design 3 versions of the Kuleshov effect	Read the one-page summary aloud and preview the next session

> Check point
>
> Can you give one example of a medium's conditions changing the form?

PART 12

Introduction

The first wall anyone who sets out to learn video hits is not technique but information overload. There are tens of thousands of videos on camera settings, editing programs change their interface every year, and since 2022 generative AI has joined in, so what you learned yesterday is outdated today. Many people wear out chasing tools.

Step back a little and the picture changes. When the Lumière brothers filmed a train arriving in 1895, the questions were already there: how much to put in the frame, how long to show it. The principles the Soviet filmmakers discovered experimenting with montage in the 1920s still drive the cut editing of short-form today. Tools change every 10 years; the language of video has stood almost still for over 100.

That is why this part starts with history. Know why 24 frames, why a 180-degree shutter, why faces grow as screens shrink, and your judgment holds when a new tool appears. This is not about memorizing a timeline. It is about understanding what constraints and compromises produced each standard we now take for granted.

Background 1

What does the moving image hold on to?

Video is a technique for recording light and an old desire to hold on to time. In "The Ontology of the Photographic Image" (1945), the French critic André Bazin traced the origin of the plastic arts to the Egyptian mummy: the desire to preserve the body's form against death, the "mummy complex." Photography is special because light, not a human hand, leaves the trace of the object directly, and cinema goes a step further and embalms time itself.

Around the same time, Walter Benjamin asked an entirely different question in "The Work of Art in the Age of Mechanical Reproduction" (first draft 1935). A painting has a uniqueness that exists only here and now, its "aura." But photography and film reproduce the same image endlessly, and audiences meet it in theaters and living rooms. Benjamin saw this change as toppling the authority of art while opening a new mode of perception to the masses. A short video reaching millions of phones at once sits at the far edge of the world he foresaw.

So how do still photographs appear to move? For a long time textbooks explained it with "persistence of vision": the image lingering on the retina overlaps the next one. But since Max Wertheimer's apparent-motion experiments of 1912, researchers understand motion perception as the brain's interpretation rather than the retina's. Two lights flashing alternately at the right interval feel like one light moving. Video is ultimately an illusion completed inside the viewer's brain, and that fact is the starting point for understanding editing and animation.

In the two volumes of Cinema in the 1980s, the philosopher Gilles Deleuze divided the film image into the "movement-image" and the "time-image." In classical cinema time flows along a chain of action and reaction. In postwar European cinema, scenes where characters cannot act and merely look, and time that drifts without purpose, began to fill the screen. An ad that tries to provoke a response within 3 seconds speaks the language of the movement-image; a brand film that leaves room with long takes borrows the sense of the time-image.

Every technique in this book returns to three questions. What to hold on to, whom to deliver it to, and what to let complete itself in the viewer's mind. The video

maker is a technician of light and a designer of the audience's perception and memory.

Further reading — André Bazin, "The Ontology of the Photographic Image," What Is Cinema? · Walter Benjamin, "The Work of Art in the Age of Mechanical Reproduction" · Gilles Deleuze, Cinema 1: The Movement-Image, Cinema 2: The Time-Image

PART 12 What is video?

12.1 Defining video and the principles of perception

Nothing actually moves. Movement is made not on the screen but in human perception.

Note The zoetrope's slits act as a shutter, and the brain fills the gaps between drawings with motion

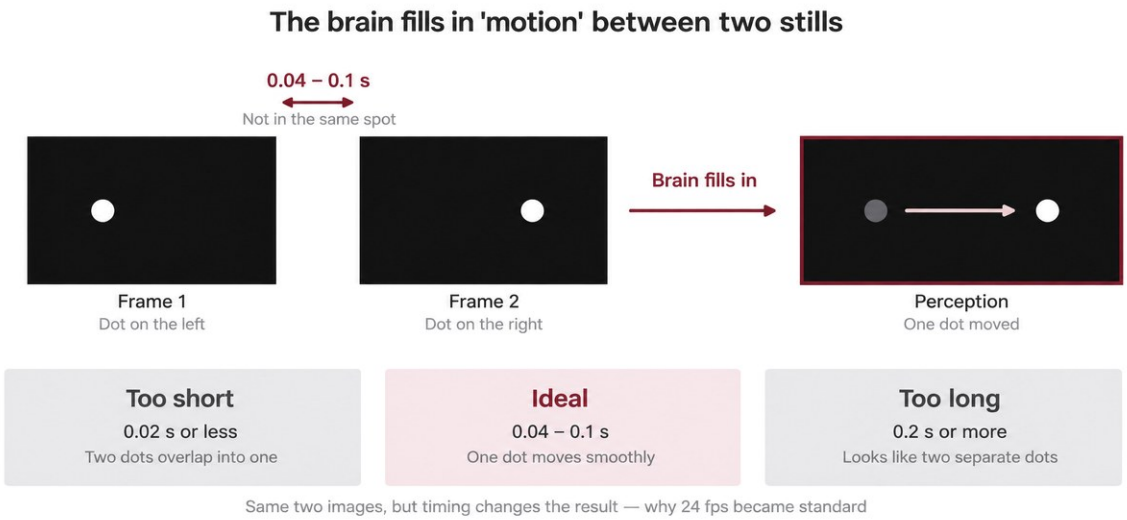

Figure 110 The phi phenomenon — the brain fills the gap between two still stimuli with motion

Term

Apparent motion — stimuli that are in fact still appear to move through the brain's interpretation.

Video is a medium that strings still pictures together fast enough to be perceived as motion. The fact that video production is ultimately the design of the viewer's cognition starts here.

Afterimages and the phi phenomenon

The old explanation

Persistence of vision

- The retinal image lingers about 0.05 s after the stimulus is gone
- Cannot explain the sense of smooth motion

1912 · Wertheimer

Phi phenomenon

- The brain fills the gap between two stimuli in different positions with movement
- Today's main explanation of motion perception

Integration

Beta movement

- Successive still images in different positions are integrated as one moving object

About 50Hz

Flicker fusion threshold

- The rate at which flicker begins to feel like steady light
- Why early projectors flashed each frame two or three times

16 fps
Motion is perceived but judder remains

24 fps
The compromise between smooth motion and film consumption

0.05 s
How long an afterimage lingers on the retina

TIP

The cinematic feel of 24fps is not a physical necessity but a convention learned over 100 years. Use frame rate as an emotional tool.

> Video is ultimately an illusion completed inside the viewer's brain.
>
> 12.1 Defining video and the principles of perception

Exercise 12.1

Task	Shoot 12 consecutive photos on a smartphone to make 1 second of motion. Play the same 12 frames at 6fps, 12fps and 24fps and compare.
Tip	Use a tripod and move only the subject, a little at a time. If the background shifts, you see shake before you see motion.
Assessment	Did they explain in one sentence how frame rate changes the impression of motion? Are the intervals even?
Model answer	Muybridge's galloping horse sequence. Put the same 12 frames played at different speeds side by side and prove the difference yourself.

PART 12 What is video?

12.2 Devices before cinema

A history of devices that tried to capture motion. Cinema was not invented in a day; it appeared on top of an accumulation of devices. Each one already held one concept of today's video production.

Note Even before cinema, the form of watching together in a dark room was already complete

17th c.	1832	1878	1882	1888	1891
Magic lantern Glass-plate pictures projected large onto a wall. Direct ancestor of projection mapping	**Phenakistoscope · zoetrope** Frame and shutter combined for the first time	**Muybridge** 12+ cameras prove all four hooves leave the ground. The start of high-speed photography	**Marey** Chronophotography. Successive motion layered on one plate to visualize time	**Le Prince** Roundhay Garden Scene. The oldest surviving motion picture	**Kinetoscope** One person peering in alone. The same structure as mobile viewing

What to take from this

The principle that a medium's physical conditions determine its form is the same now as 130 years ago.

> **When the way of watching changes, the form of content changes**
>
> The kinetoscope was for watching alone, briefly, and held short attractions to match. The vertical smartphone screen produced the short-form format by the same logic.

Exercise
12.2

Task	Make a thaumatrope or flipbook from paper and record it in a 10-second video.
Tip	The simpler the drawing, the better it moves. Start with a single bouncing circle.
Assessment	Did they explain the afterimage principle correctly? Does the device actually work?
Model answer	Restored zoetrope pieces. Connect the device's principle to today's GIF and short-form loops.

PART 12 What is video?

12.3 The birth of cinema and the silent era

December 28, 1895, the Grand Café in Paris: the Lumière brothers' paid Cinématographe screening. The moment video became a medium of collective experience.

Note A silent-era set, where the cranking speed was the frame rate

30 years of silent film — from record to magic, and then to sound

Arrival of a Train, 1896 · Lumière

One locked-off shot, 50 seconds. A train approaching on the diagonal — legend says the audience fled

A Trip to the Moon, 1902 · Méliès

Stop trick · multiple exposure · hand tinting. The moment film went from "record" to "magic"

The hand-cranked camera, 1910s

Crank speed was the frame rate. Around 16 frames a second, which is why silent film looks fast

The Jazz Singer, 1927 · the first sound feature

Song and dialogue synchronized to picture. The silent era ended within 2 years

Figure 111 Four scenes of the silent era — record (Lumière), magic (Méliès), the speed of the hand (crank), and sound (talkies). Scenes recreated with generative imagery, not actual film frames.

Term

Category	Edison Kinetoscope	Lumière Cinématographe
Viewing	One person peering in	Many at once

Cinématographe — the Lumière device that was camera, printer and projector in one.

Category	Edison Kinetoscope	Lumière Cinématographe
Device weight	Heavy, fixed	Light, portable
Power	Electric	Hand crank
Shooting location	Mostly studio	Mostly outdoors
Legacy	Personal viewing model	Theatrical model

The grammar early cinema invented

Méliès

Special effects

- Stop tricks, multiple exposure, miniatures
- A Trip to the Moon, 1902 — the starting point of staged fiction

Porter · 1903

Discovering editing

- The Great Train Robbery intercuts scenes in different places
- Different spaces, joined together, become a story

Griffith

Classical editing

- Close-ups, cross-cutting and eyeline matching systematized
- The basic form of continuity editing today

Soviet

Montage theory

- Kuleshov effect — the same face reads differently depending on the shots around it
- Eisenstein — two colliding shots create a third meaning

> Meaning lies not within one cut but between two. Before collecting good cuts, design the order you will join them in.
>
> 12.3 A sentence to use on set

Exercise

12.3

Task Shoot a 'scene from everyday life' the Lumière way: locked-off camera, one shot, under 50 seconds.

Tip There is no editing, so wait for the moment the event enters and leaves the frame.

Assessment Are beginning · development · end visible without moving the camera? Why that framing?

Model answer Lumière's Arrival of a Train. A diagonal composition builds depth and puts the event's peak at the center of the frame.

PART 12 What is video?

12.4 Sound, color, widescreen

Technology always arrives first as a constraint, and becomes a means of expression a few years later.

Note

When the microphone came in, the camera was locked in a soundproof housing and the picture briefly retreated into stillness

1927
Talkies
The Jazz Singer succeeds. Camera noise forces the camera into a soundproof booth; the picture goes static

1932
Technicolor
Saturated three-strip color. Used first as a staging device rather than for realism

1953
Widescreen
CinemaScope spreads. A theater-only experience to counter TV. The origin of 21:9

1960s
Lightweight cameras
Sync-sound gear spreads. Nouvelle Vague and direct cinema; handheld becomes an aesthetic

1970s
Steadicam
Long, steady moving shots without dolly track. The language of direction expands

1977–1993
Compositing · CG
Optical compositing, motion control, computer graphics. The line between live action and the virtual blurs

Note

New technology does not always widen expression. The locked-off camera of early talkies is the first lesson.

The locked-off camera of early talkies, the overblown color of early Technicolor, the thin tonal range of early digital all followed the same path. Generative AI video is on that path now.

Exercise
12.4

Task	Edit the same scene in two versions, black-and-white · silent / color · sound, and compare audience reactions.
Tip	In the sound version, add ambience before dialogue. The space comes alive first.
Assessment	Did they write down specifically what information sound and color added?
Model answer	Compare silent-era expressionism with early talkies. Note also 'what was lost when sound arrived.'

PART 12 What is video?

12.5 Television and broadcast video

A small screen, a bright living room, distracted viewing, a structure interrupted by ads. These conditions made the grammar of broadcast video.

Note The studio structure of switching between cameras in real time carries on into today's live broadcasts and live commerce

Condition	Cinema	Television	Today's heir
Screen size	Large	Small	Mobile
Ambient light	Dark	Bright	Outdoors
Attention	Immersed	Distracted	Scrolling

Condition	Cinema	Television	Today's heir
Default shot	Long shots	Close-ups	Close-ups
Sound	Detailed mix	Clear dialogue	Caption-reliant
Structure	Long narrative	Segments	3-second hook

TIP

The rule that faces, hands and products grow as the screen shrinks has held for over 60 years.

On a small screen the information in a long shot does not read, so broadcast made the close-up its staple. For the same reason, vertical short-form today is overwhelmingly close-ups.

Working concepts broadcast created

hh:mm:ss:ff

Timecode

- Notation that locates a position to the frame
- The common language of editing communication

Edge margin

Safe area

- Keep important information inside, away from edges that may be cropped
- Now continues as the area hidden by platform UI

One-person operation

ENG reporting

- One person runs both camera and microphone
- The prototype of the solo creator's production structure

Real-time switching

Live switching

- Switching between multiple cameras in real time
- Used as is in live commerce and streaming

Exercise
12.5

Task Break down one TV news segment (about 1 min 30 s) shot by shot in a table.

Tip Log the order and length of anchor · report · interview · stand-up in seconds.

Assessment Reads broadcast grammar (order of information, roles of picture · captions) accurately

Model answer Sets TV news and a YouTube video on the same event side by side and shows the differences in pace and structure in numbers.

12.6 From analog video to digital

Recording made editing possible, and nonlinear editing changed the very way we think about editing.

Note Until nonlinear editing arrived, the linear suite, where tape could only be joined in order, defined how editors thought

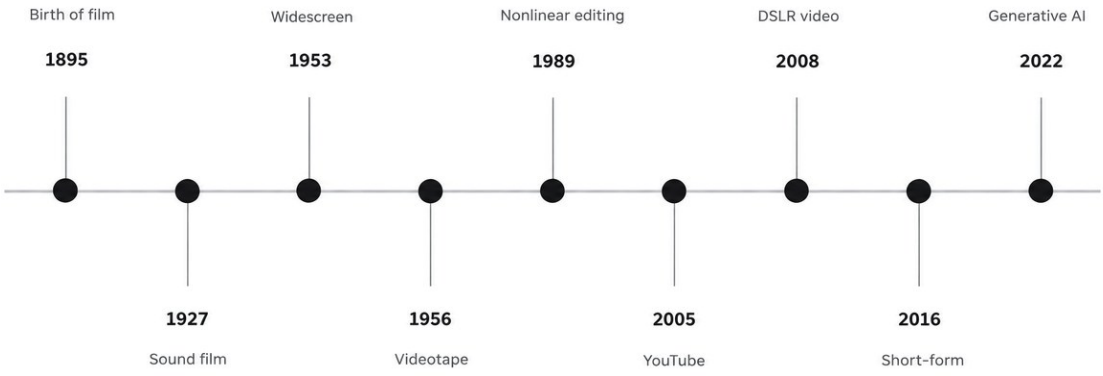

Figure 112 Key turning points in video technology

— **1956** Broadcast videotape recorders become practical. TV is no longer live-only

— **1970s–80s** Home video format war and the spread of camcorders. Individuals shoot and keep their own footage

— **1989** Nonlinear editing systems go commercial. Instant access to any point
— **1995** The DV format. Digital quality on cheap tape; independent production explodes
— **1999–2003** Desktop editing software spreads. The personal computer becomes the edit suite
— **2008** DSLRs that shoot video arrive. Large-sensor shallow depth of field at low cost — the DSLR revolution
— **2010s** Mirrorless · cinema cameras, 4K, log recording and gimbals become standard tools

Linear editing mindset

- Work only in sequence
- Inserting mid-sequence is very hard
- One mistake means starting over
- Must be fully planned in advance
- The editor's planning skill is key

Nonlinear editing mindset

- Instant access to any point
- Endless trial and error
- Version control is the new challenge
- Exploration over planning
- The editor's selection skill is key

Note

Being able to revise endlessly makes you put off decisions.

The spread of nonlinear editing has clear side effects too. This is exactly why the habit of drawing a storyboard before shooting still matters.

Exercise 12.6

Task	Find one old recording medium at home (photo, tape, file), digitize it and document the process.
Tip	Note the original's resolution, aspect ratio and color condition first so you can compare.
Assessment	Explains analog vs. digital in terms of resolution · copying · degradation
Model answer	Places before-and-after images side by side and sums up what was gained and what was lost.

PART 12 What is video?

12.7 The age of internet video and platforms

Once the distribution barrier fell, the devices for shooting, watching and distributing merged into one.

Note

With the distribution barrier gone, a single room became a studio handling shooting · editing · distribution

2005	2007	Early 2010s	2016–2020	2020–2022	2022–
YouTube	**Smartphone**	**Revenue sharing**	**Vertical · short-form**	**Pandemic**	**Generative AI**
Anyone can upload and watch. The first event to remove the distribution barrier	Shooting · viewing · distribution devices become one	Ad-based model. Video becomes a job; the creator profession emerges	The scrolling interface changes viewing habits; the first 3 seconds become critical	Live commerce, online classes and remote production become routine	Text-to-video and image-to-video tools enter professional practice

TIP

Horizontal video often opens with the situation; vertical, with a face and the conclusion.

Exercise

12.7

Task	On one topic, plan a 2-minute horizontal video and a 30-second vertical one, and compare their first 5 seconds.
Tip	Horizontal video often opens with the situation; vertical, with a face and the conclusion.
Assessment	Design shows that the opening frame plays a different role on each platform
Model answer	Fits one message to both formats, varying even the cut count, caption position and music start point.

PART 12 What is video?

12.8 The landscape of the generative AI video era

Everything on screen used to be something someone shot or drew; now it may not be. Speed, cost structures and ethical standards are all shaken at once.

Note Choosing and judging cuts no one shot has become the maker's new job in the generative AI era

Area	Tool type	Role in practice	Cautions
Planning	Conversational language models	Idea expansion, script drafts, copy variations	Fact-check; humans make the final call
Image	Image generation models	Mood boards, concept art, storyboard drafts	Check training data and commercial-use terms
Video	Text/image-to-video generation	Inserts, backgrounds, impossible scenes	Consistency is still a challenge
Voice	Speech synthesis	Scratch narration, multilingual dubbing	Never clone a real person's voice
Editing	Auto captions, auto cuts	1st-pass rough cut, caption generation	Always proof proper nouns for errors
3D	Image-to-3D generation	Props, character prototypes	Polygon cleanup needed

What AI cannot replace

Deciding what to shoot, explaining why it has to be this cut, reaching agreement with the client, judging the unexpected on set. The more powerful the tools, the more judgment is worth.

TIP

Replace the whole process with AI and quality collapses; refuse it entirely and you fall behind on speed.

What matters is designing where generative AI fits in. This book recommends limiting it to three points.

01	02	03
Planning stage	**Draft stage**	**Post-production stage**
Expanding ideas	Visualization	Automation

Exercise
12.8

Task	Make 3 cuts of 5 seconds each with generative AI and compare them with cuts of the same scene you shoot yourself.
Tip	Write shot size, lens, lighting and movement into the prompt in film terms.
Assessment	Tool-use log and copyright · portrait-rights checks kept; strengths and weaknesses of both methods stated concretely
Model answer	Mixes AI cuts in among shot cuts, discloses their use, and submits the prompt revision history.

PART 12 What is video?

12.9 A brief history of the Korean screen industry

From kino-drama to global streaming and short-form commerce, the Korean screen industry has created new professions with every technological shift.

Note

The growth of 1990s producer-planned films and the ad industry built today's Korean production workforce

1919

Righteous Revenge

A kino-drama screening. The starting point of Korean film history

1926

Arirang

Na Woon-gyu's landmark silent film; a huge popular response

1956–

Television

Broadcasting begins under a public broadcasting system. Broadcast staff trained at scale

1990s

Planned films

Conglomerate capital flows in; advertising matures. Commercial directors move into film

2000s

Multiplexes

Korean films gain market share; demand splits across cable · general channels

2010s

K-pop · YouTube

Music videos raise production standards; running a channel becomes basic corporate PR

2019–

Global streaming

Global demand for Korean content surges. More demand for camera · lighting · art · post crews

2020s

Short-form · commerce

A large share of new jobs. In-house brand video roles expand

TIP

Always verify title, year and producer, and cite your sources.

Exercise

12.9

Task Pick one year in Korean screen history and research one landmark work each in film · broadcasting · advertising.

Tip Always verify title, year and producer, and cite your sources.

Assessment Factual accuracy; link between historical context and form

Model answer Points out how technical change (e.g. color broadcasting, the digital transition) affected form.

PART 12 What is video?

12.10 Working principles from history

Six working principles drawn from history. What 130 years of history left behind is not a timeline but six sentences you can put straight into a proposal today.

Note Rather than memorizing a timeline, this section aims to draw from a single scene a principle you can use now

01 **The medium makes the form.** Screen size, viewing distance, ambient noise and controls decide a piece's length and shot sizes. Start planning without choosing a platform and you will end up remaking it.

02 **Meaning lies between cuts.** A principle unchanged since Kuleshov. Before gathering good material, decide the order you will join it in.

03 **New technology is a constraint first.** A new tool narrows expression at first. Use it before others do, but put it in the final piece only when you can absorb its limits into your direction.

04 **Standards are conventions.** 24fps, 16:9 and the 180-degree shutter are agreements, not laws of physics. Know the reasons and you can break them on purpose.

05 **Smaller screen, bigger everything.** As the screen shrinks, subjects get bigger, cuts get shorter and captions grow. The core rule for mobile.

06 **Distribution changes creation.** Since YouTube removed the distribution barrier, planning starts not from the idea but from discoverability. That is why titles and thumbnails became part of directing.

TIP

Don't explain the principle in words; show it on screen.

Exercise 12.10

Task	Pick one of the six working principles and prove it in a 1-minute video.
Tip	Don't explain the principle in words; show it on screen.
Assessment	Principle and result match; intent reads without explanation
Model answer	Shows a version that follows the principle and one that breaks it, side by side.

PART 12 What is video?

12.11 Theory that changes your work on set

Theories that change your work on set once you know them. Theory is not used on set right away, but it lets you explain why something must be done. Only those who can explain can persuade a team and win over a client.

Note

Theory gives you the language to explain to others the choices you made on set

Editing

Kuleshov effect

- The same blank face reads as hunger · grief · desire depending on the shots around it
- Basis for ads that pair a product with emotional images

Editing

Montage of collision

- Two clashing images create a 3rd meaning
- Theoretical basis of comparison ads and twist structures

Editing

Continuity editing

- Joining shots so smoothly the audience doesn't notice the editing
- 180-degree rule, eyeline match, match on action

Sound · world

Diegesis

- Radio music in the scene is diegetic; background score is nondiegetic
- Crossing between them on purpose has a strong effect

Gaze

Point of view and focalization

- Whose eyes we see through
- Camera position, POV shots and narrative voice must work together to stay consistent

Learned by the audience

Genre conventions

- Low-key light in horror, warm backlight in romance
- Use them to communicate without explanation; break them to draw attention

Narrative drive

Expectation and betrayal

- Making viewers predict, then subverting it
- The core of the twist ad

TIP

The face cut must last 3 seconds or more with no change in expression for the experiment to hold.

Exercise 12.11

Task	Recreate the Kuleshov effect. Join one blank-faced cut to three different cuts and ask 5 viewers what emotion they read.
Tip	The face cut must last 3 seconds or more with no change in expression for the experiment to hold.
Assessment	Controls in the experimental design, response records, logic of the conclusion
Model answer	Kuleshov's original experiment. Tabulates the responses to show in numbers that editing creates meaning.

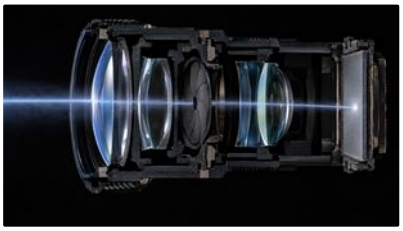
PART 12 What is video?

12.12 The birth and principles of photography

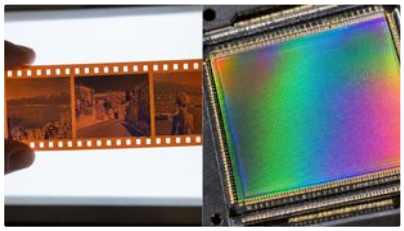
A story from the dark room to the smartphone. Photography was born before video, and nearly every video technology stands on photographic technology.

A camera is a hole that gathers light and a surface that receives it

① Pinhole — light travels straight
The outside scene passes through a tiny hole and lands upside down on the wall. The smaller the hole, the sharper and darker



② Lens — gathers light to a point
Glass bends light so the image is both bright and sharp. The aperture sets the amount, the shutter the time



③ Recording surface — from silver to electricity
In film, exposed silver grains turn black; in a sensor, pixels turn light into charge

Figure 113 How a camera works — starting from a single pinhole, it was completed as lens · aperture · shutter · recording surface were added in turn.

Term

Photography began with attempts to fix with chemicals this image, which painters had used since the Renaissance as a drawing aid.

Camera obscura — Latin for 'dark room'. Light entering through a small hole projects the outside scene upside down on the opposite wall.

The five elements of a camera

01 Dark box
The body that lets in only the light you want. The word comes from the Latin for room (camera)

02 Lens
Gathers more light to a point than a pinhole. Focal length sets the angle of view

03 Aperture
Size of the opening light passes through. Changes brightness and depth of field together

04 Shutter
How long light comes in. Freezes motion or lets it flow

05 Recording surface
On film, silver halide grains turn black to leave an image; on a sensor, pixels turn light into charge, stored as numbers

Camera history moved toward shorter exposures, smaller bodies and simpler printing

16th c.–
Camera obscura
A painter's drawing aid

1839
Daguerreotype
Minutes-long exposure, one of a kind

1851
Wet plate · large format
Glass negative, endless copies

1888
Roll-film box camera
Photos anyone can take

1925
35mm compact camera
Movie film used for stills

1948
Instant camera
A print in minutes

1950s–60s
Single-lens reflex (SLR)
Shoot exactly what you see

1975
Digital camera prototype
Electric signals, no film

1990s–2000s
Digital compacts spread
Shoot and check at once

2000–
Camera phone · smartphone
Shoot, fix, post

Figure 114 How the camera changed — 200 years of shrinking exposure times, sizes and printing steps. From top left to bottom right, "the one who shoots" widens from painters to everyone.

How it developed

- **1826–27 Niépce** The oldest surviving photograph, View from the Window at Le Gras. An exposure of several hours
- **1839 Daguerre** The daguerreotype. Very sharp on a silver plate, but a single image that cannot be copied
- **1841 Talbot** The calotype. Many positives from one paper negative — the start of the negative · positive system of copying
- **1851 Archer** Wet plate (collodion). The sharpness of glass negatives with exposures of seconds. Portrait studios go mainstream

- **1888 Eastman** Roll-film box camera. "You press the button, we do the rest" — shooting separated from developing
- **1907 Autochrome · 1935 Kodachrome** The first commercial color photography process, and color film with multilayer emulsion
- **1925 35mm compact camera** Movie film used for stills. Street photography and photojournalism; today's full-frame sensor standard
- **1948 Instant photography** A photo in your hand within minutes. The start of seeing results right away
- **1975 Digital prototype** Kodak's Steven Sasson records about 0.01 megapixels onto cassette tape
- **2000s onward** Camera phones and smartphones put shooting · retouching · sharing in one device. Computational photography that merges many frames becomes standard

Reference photos 12.12A Generated images — staging reference

b Early digital compact camera and memory card

c Smartphone multi-lens camera

Link to video

Motion picture film is the technique of exposing photographic film at 24 frames in 1 second.

In photography's history, as exposure times shortened, what could be photographed widened to things in motion. Muybridge's 1878 sequence of a running horse is the bridge between photography and

Aperture, shutter and sensitivity carried straight over into video (3.5).

cinema.

> Whatever new camera comes out, there are only five principles. First check which one changed: box, lens, aperture, shutter or recording surface.
>
> 12.12 A sentence to use on set

Exercise 12.12

Task	Make a pinhole camera from a box and foil and photograph the upside-down image of the view outside the window.
Tip	Make the hole small and round with a needle, and the room as dark as possible.
Assessment	How the image forms explained with a drawing; relation between hole size and sharpness
Model answer	Camera obscura records. Tries three hole sizes to show the trade-off between sharpness and brightness.

PART 12 What is video?

12.13 From darkroom to print

From silver gelatin prints to CMYK printing. Before digital, a chemical process stood between shooting and seeing. Screens add light; print subtracts it.

The darkroom — how exposed film becomes a photo on paper

① Negative and positive
The negative (film), where bright things come out dark, is reversed again into a positive (photo paper)

② Enlarger — under the red safelight
Light passes through the negative and is projected onto photo paper. A lens sets size and focus

③ Film developing — in a lightproof tank
Develop → stop → fix → wash → dry. At 20°C, temperature and time decide the result

④ Print developing — the image appears
About 1 minute in developer as the image darkens on the paper → stop → fix → wash

Figure 115 Darkroom work — from negative to positive. Before digital, developing and printing took more time than shooting.

Term

Negative — film whose exposed areas turn black, reversing light and dark.

Projected onto photo paper again, it becomes a positive with the tones restored.

The five steps of film developing

01	02	03	04
Develop	**Stop**	**Fix**	**Wash and dry**
Turns exposed silver grains into black metallic silver. Temperature and time decide the result	A weak acid bath halts development	Dissolves unexposed silver so it no longer reacts	Wash out chemicals thoroughly and dry somewhere dust-free. Leftover chemicals cause discoloration years later

Printing — editing under the enlarger

Selecting

Contact print

- Negatives laid on photo paper to see every frame on one sheet
- Choosing which frames to use is the origin of editing

Enlarging

Enlarger

- A lens projects the negative large, printed at the size you want
- Exposure time is brightness

Refining

Dodging and burning

- Hands or card hold back or add light in places
- Where Photoshop's dodge · burn tools got their names

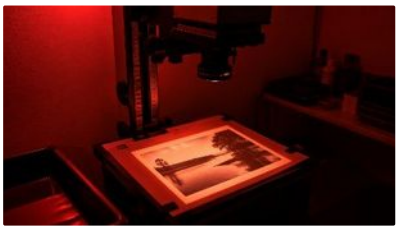
Workspace

Red safelight

- Black-and-white paper barely reacts to red light
- Lets you see what you are doing

Reference photos 12.13A Generated images — staging reference

a Darkroom under a red safelight



b Enlarger — projecting a negative onto photo paper

c An image appearing in the developer

Reference photos 12.13B Generated images — staging reference

a Negative film and loupe on a lightbox

b Contact print — chosen frames marked

c Prints drying after the wash

How color is printed

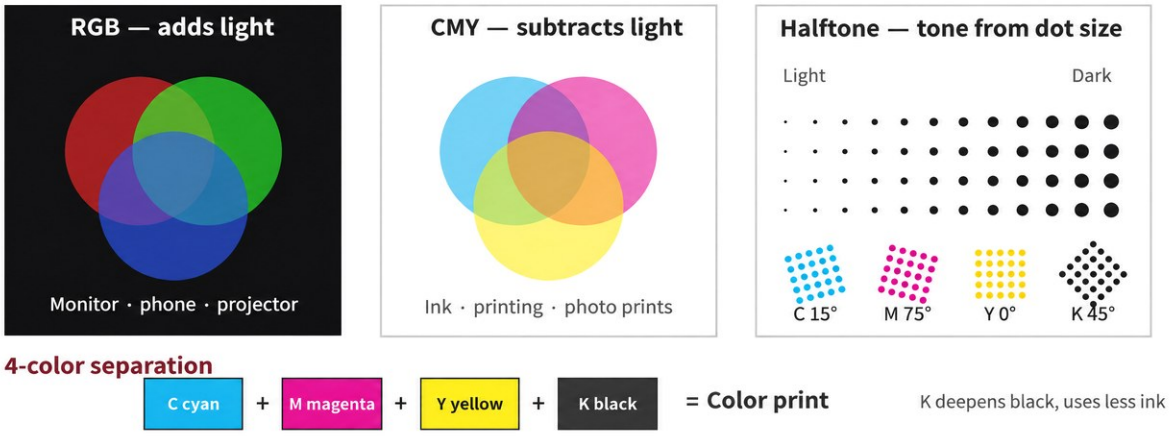


Figure 116 Color of light, color of ink — RGB, CMYK, halftone dots

Additive mixing

RGB

- The three primaries of light. Adding brightens; all combined make white
- Monitors · smartphones · projectors

Subtractive mixing

CMY + K

- Ink primaries cyan · magenta · yellow. Layering darkens
- Overlapping CMY gives a muddy brown, so a separate black (K, key) ink is used

Gradation

Halftone dots

- Builds tones from dot size and spacing instead of ink density
- Each plate set at a different angle to avoid moiré

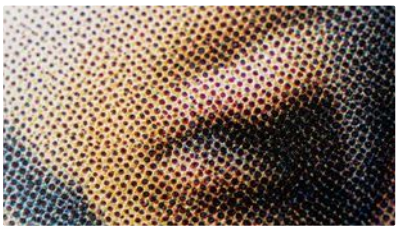
Proofing

Color conversion

- Printing an RGB image as is loses saturation
- Convert to CMYK, then check on a proof

Reference photos 12.13C Generated images — staging reference

a 4-color offset press — four plates, C · M · Y · K



b Halftone close-up — CMYK rosette pattern

c Proof and loupe — checking print color

TIP

Don't use the same file for both screen and print.

Why video makers need this

72–150 ppi	300 ppi
Screen · RGB	Print · CMYK

Film posters, packaging, merchandise, exhibition catalogs: video work ends up going out with print. Photoshop's layers, curves, dodge and burn, and masks all carry over darkroom and print-shop work. Know the principles and the tools come easily.

> Screens add light; print subtracts it. Always check any image going to print on a CMYK proof.
>
> 12.13 A sentence to use on set

Exercise
12.13

Task	Convert one photo to RGB and to CMYK, print both and record the color differences.
Tip	Lower your monitor brightness and check with a print preview (soft proof) first.
Assessment	Explains additive · subtractive mixing accurately; finds out-of-gamut colors
Model answer	Marks colors that fall apart in print, like vivid blue · fluorescent green, and proposes alternatives.

PART 12 What is video?

12.14 The devices we watched on

From the magic lantern to the smartphone, video's form was decided by viewing devices as much as by shooting technology (12.2). Each time the device changed, the length, size and grammar of video changed with it.

Figure 117 Optical toys for viewing moving pictures

Toys that showed motion

1825	1832	1834	1868	1877
Thaumatrope	Phenakistoscope	Zoetrope	Flip book	Praxinoscope
Flip a disc fast and the pictures on front and back merge into one. A bird and a cage	Plateau's spinning disc. Pictures seen in a mirror through slits	Horner's spinning drum. Several people watch a picture strip through slits at once	The simplest device, viewed by flipping pages. The best tool for teaching the principle	Reynaud used mirrors instead of slits for a brighter, sharper image. Led to the Théâtre Optique

Reference photos 12.14A Generated images — staging reference

a Magic lantern — projecting glass slides

b Zoetrope — motion seen through slits

c Phenakistoscope — a spinning disc in a mirror

Viewing moved from a dark room shared with others to a private screen in the hand

17th c.
Magic lantern

2020s
Vertical short-form · spatial video
Scrolling and immersion

Figure 118 How viewing devices changed — from a shared dark room to a screen in the hand, and back inside the screen.

Viewing changed along four paths

Dark room · many

Projection

- Magic lantern → film projector → slide projector · OHP → digital projector
- A big screen, watched together

Alone · inside a device

Peering in

- Zoetrope, Kinetoscope
- This lineage returns with the VR headset

Bright room

The living-room screen

- CRT TV → video · DVD → flat-panel TV · OTT
- A grammar of close-ups and dialogue grows

Alone · anywhere · vertical

The screen in the hand

- Smartphone
- Why the first 3 seconds, captions and vertical framing matter

Reference photos 12.14B Generated images — staging reference

a Kinetoscope — a box viewed one person at a time

b 35mm film projector in a projection booth

c Slide projector — 35mm slides in a carousel tray

Term

Slide — a single 35mm frame of reversal film in a mount. Slides were loaded into a carousel tray and projected; the 'slide' of presentation software comes from this.

A history of slides and presentation screens

- **35mm slides** Reversal film mounted frame by frame and loaded in order into a carousel tray for projection
- **OHP** Projects material on transparencies in classrooms and meeting rooms. Later came document cameras, digital projectors and presentation software
- **8mm home movies** A culture of shooting at home and projecting onto a living-room screen. Much like today's vlogs

Reference photos 12.14C Generated images — staging reference

a 8mm home movie projector

a Videotape and VCR

b Flat-panel TV and streaming

c Handheld screens and VR — the personal screen

Rules the changes left behind

01 The more screens moved into bright rooms, the more close-ups and captions there were.

02 The more personal the screen became, the shorter and more vertical video got.

03 Once rewatching was possible, editing shifted from making things clear in one viewing to dense cutting that assumes repeat viewing.

> On the first line of your proposal, write what device this video will be watched on, where, and by how many people together. The form is decided there.
>
> 12.14 A sentence to use on set

Exercise
12.14

Task	Interview family or neighbors about the devices and places where they once watched video, and make it into a 3-minute video.
Tip	Asking 'where, and with whom' draws richer answers than asking 'what did you watch'.
Assessment	Interview shooting basics (lighting, audio, eyeline); summary of how things changed over time
Model answer	Intercuts the interviews with contrast cuts: photos of the old devices and today's smartphone screens.

PART 12 wrap-up

Exercises and review

01 **Count the cuts in the first 30 seconds**

Take 1 favorite video, step through its first 30 seconds cut by cut, log the number of cuts and the length of each, and calculate the average cut length.

02 **The Kuleshov effect in 3 versions**

Shoot 1 blank-faced close-up, put a different image (food, a window view, a person) before and after it, and check the three versions yourself.

03 **Comparing 3 platforms**

For 3 platforms you watch often, tabulate video length, aspect ratio, captions or not, and how the first 3 seconds are built.

Self-check

- Explain the difference between the phi phenomenon and persistence of vision
- Explain how 24fps became the standard
- Give an example of the Kuleshov effect applied to ad planning
- Explain why television came to center on close-ups
- Name a side effect nonlinear editing had on how we work

One-page summary

12.1 Principles of perception	Motion is made not on the screen but in the viewer's perception. Making video is designing cognition.
12.4 · 12.10 Standards are conventions	24 frames, 16:9 and the 180-degree shutter are not laws of physics but the result of technical compromise and convention. Know the reasons and you can break them on purpose.
12.2 · 12.14 Viewing conditions and form	Just as the Kinetoscope created short attractions, the vertical screen created short-form.
12.3 · 12.11 Meaning between cuts	Meaning arises not within one cut but between two. A principle unchanged since Kuleshov.
12.4 · 12.8 New technology is a constraint first	New technology always arrives first as a constraint and only later becomes a means of expression. Generative AI is on the same path.
12.5 · 12.7 Smaller screen, bigger everything	As the screen shrinks, subjects get bigger, cuts get shorter and captions grow.
12.6 Nonlinear editing	Being able to revise endlessly makes you put off decisions. That is why a storyboard before shooting still matters.
12.12 · 12.13 From photography to print	A camera works on just five principles: box · lens · aperture · shutter · recording surface. Screens add light; print subtracts it.

Questions to consider

Q **Explain why 24 frames became the standard, separating technical constraint from convention.**

The technical constraint is the compromise between film consumption and continuity of motion; the convention is the 'cinematic feel' learned over the 100 years since.

Q **Consider what way of viewing the video you are making now assumes, and how that assumption is changing its form.**

Write on the first line of your proposal what device it will be watched on, where, and by how many people together, and the answers on length · shot size · captions follow.

Field tips

- In meetings, don't describe a reference in words; send the link with the time range. Just writing "from 3:45 to 4:10" cuts meeting time in half.
- When learning a new tool, first find out not its feature list but the existing process it replaces. Know its place and you learn faster.
- If you don't know an industry term, ask on the spot. The term you pretended to know causes the biggest accidents.

MEMO · PART 12

What you make in this PART

1. An exhibition loop that reads within 30 seconds from any point
2. A real-time piece that responds to a single viewer gesture
3. Install drawing · gear list · run plan
4. A 250-character statement, one-page portfolio, open-call schedule

Media art and expanded cinema

If a video is complete only when the audience moves, who made it? This PART asks again, from where we stand today, the question Nam June Paik opened. When the screen leaves the rectangle, the audience turns from watchers into participants, and the work must run itself in a gallery for a month, most of what a video maker has learned is still useful. Only the way you use it changes.

Photo OPEN-13 PART divider full-page photo · generative image

Using this chapter in class

Understand how the premises of regular video and media art differ, make a piece that responds to the audience with real-time tools, install · run · document it so it works in a gallery for a month, and apply to an open call.

Materials Laptop with webcam, a free real-time tool (TouchDesigner non-commercial or p5.js), 1 existing video of yours, tape measure, printout of a Seoul public media art open call

10 min	20 min	40 min	30 min	20 min
Intro	New premises	Make	Install math	Wrap-up
Play an existing video for 30 seconds from a random point and ask what it's about	13.2 Use the table to compare viewer position · start and end · aspect ratio · repetition; sketch a loop	13.4 Build a webcam-reactive piece from a one-line rule like 'it brightens when someone comes close'	13.5 For a 6m wide × 4m deep × 3m high gallery, work out throw ratio · image size · power routing	13.6 Write a 150-character statement starting 'This work is …' and read each other's

> Check point
>
> Can you say in one sentence what happens when the viewer does what, and does it run 10 minutes without stopping?

Background 23

The man who turned television around

Note

An homage to Paik-style television towers — a form that stacked the receive-only box and turned it into a medium for making. "The More, the Better" used 1,003 sets

In 1963, "Exposition of Music — Electronic Television" opened in a small gallery in Wuppertal, Germany. Thirteen televisions stood in the room. Some had distorted pictures; on others the image changed when visitors pressed a foot pedal or made a sound into a microphone. It was the first solo show of Nam June Paik, born in Seoul in 1932, and is now called the starting point of video art.

Television then was a device for receiving at home whatever the broadcaster sent. Paik set out to reverse that one-way flow. He let viewers intervene in the picture, and later built his own video synthesizer for shaping the video signal by hand. He turned a medium of receiving into a medium of making.

He joined Fluxus in 1962, part of a movement erasing the line between everyday life and art, and after meeting John Cage in 1958 he brought an Eastern sense of time into his work. In "TV Buddha" (1974), a Buddha statue sits before a television, gazing at its own image relayed by a camera. Meditation and closed circuit, the cyclical time of the East and the electronics of the West meet on one screen.

His vision reached beyond the work, too. In a 1974 proposal to the Rockefeller Foundation he first used the term 'electronic superhighway,' 20 years before the internet became widely known. On January 1, 1984, he aired "Good Morning Mr. Orwell," a live broadcast linking New York, Paris and Seoul by satellite. Where Orwell had pictured 1984 as the year of surveillance, Paik set out that same year to show the other side: technology could also connect people.

"The More, the Better," built at the MMCA Gwacheon for the 1988 Seoul Olympics, is a tower of 1,003 televisions stacked 18.5 meters high. It went dark in 2018 and came back on in 2022 after 4 years and 7 months of conservation work. The restoration exposed media art's hardest problem. If its parts are discontinued, what does the work survive as? The conservation issues discussed later start here.

PART 13 Media art and expanded cinema

13.1 What is media art?

Media art is less a genre than an attitude. It is the umbrella term for work that takes the new media of its time as material and explores how those media change people and the world. In the 1960s that was television, in the 1990s the internet, and now sensors, data and generative models.

Note

Interactive media art — the viewer's actions change the state of the work. Today's materials are sensors and data

Why there are so many names

Video art

Late 1960s

- Emerged as portable video gear spread
- Twisting TV's language, or showing viewers themselves on closed circuit

Media art

A broader name

- Came into use as materials widened beyond video to computers, networks and sensors

New media art

From the 1990s

- Work premised on digital and the internet
- Weakness: the 'new' grows old with time

Post-internet art

After the internet became like air

- A contested term with no agreed academic definition

Note

You don't need to memorize the terms. But borrow one to describe your work without knowing what it means, and reviewers will spot it at once.

Concepts that make texts readable

Term	Meaning	Who said it
Generative art	Work made by a preset system of rules, usually with an element of chance	Tate glossary definition
Interactivity	Viewer actions change the work's state	A core condition of media art

Term	Meaning	Who said it
Site-specific	Work bound to the conditions of one place	Also a category in international open calls
Post-media	A state in which no single medium dominates and all media influence one another	Peter Weibel (2006)
The post-medium condition	Sees medium specificity as layered conventions	Rosalind Krauss (1999)

> Don't agonize over whether your work is media art. Just check that you can say in one sentence why it has to be this medium.
>
> 13.1 What is media art?

Exercise
13.1

Task	Pick three media artworks you've seen in the last 5 years and note, for each, what medium it used as material and why it couldn't work in any other medium.
Tip	If you can't choose, start with the past exhibition lists of the Nam June Paik Art Center, MMCA and Seoul Museum of Art.
Assessment	Does it explain how medium and theme relate? Does it go beyond mere description?
Model answer	An analysis that went as far as noting what would be lost if the same theme moved to another medium.

PART 13 Media art and expanded cinema

13.2 How video and media art differ

What's different? If you've read this far, you already have most of the skills you need. Reading a frame, building light, joining cuts and handling sound all still apply. What changes is not the skills but the premises.

Two things are the same. Both are time-based media, so length · rhythm · repetition · stillness are means of expression, and the production process of shooting · lighting · editing · grading · sound is still needed. The bigger the screen, the more your fundamentals show.

Regular video

- Viewer position — seated in front of the screen
- Start and end — fixed
- Aspect ratio — can change to suit the medium
- Equipment — a means of showing the result
- Completion — done on delivery
- Repetition — assumes a single viewing

Media art

- Viewer position — enters and moves through the space
- Start and end — viewers come and go at any time
- Aspect ratio — a condition of the work; changing it is damage
- Equipment — often part of the work
- Completion — done only after running the whole show
- Repetition — assumes hundreds of loops a day

TIP

Carry over a four-part arc as is, and most viewers see only the 'turn' and leave. It must read within 30 seconds from wherever they start watching.

What students miss most often: the start and end

Loop design

Make the end join the start

- If the last frame resembles the first, the seam disappears

Entry points

Readable wherever they come in

- Repeat the key image periodically

Length

Between 2 and 7 minutes

- Any longer and far fewer people watch to the end

Why you must keep the aspect ratio

Installation guidelines from media art conservation bodies specify that a work's aspect ratio be preserved, and state that enlarging or cropping to fit a screen is not proper practice. In video production, recutting for vertical is routine; with an artwork, that act itself changes the work. Here you must let go of the habit of reframing every time you change media.

> Make exhibition video on the premise that nobody watches from the start. Making it readable from any entry point is the design.
>
> 13.2 How video and media art differ

Exercise
13.2

Task	Re-edit one of your existing videos into an exhibition loop. Keep it under 3 minutes and structure it so the theme reads within 30 seconds from any starting point.
Tip	Show a friend 30 seconds from a random point and ask what the work is about. If two out of three get it, you pass.
Assessment	Is the seam invisible? Are the entry points designed?
Model answer	An edit that matched start and end on the same image and repeated the key motif every 40 seconds so it read from anywhere.

PART 13 Media art and expanded cinema

13.3 The media art landscape in Korea today

Korean media art moves along three tracks: public museums and institutions, the city's public screens, and commercial immersive venues. Each asks for different things, and each has a different door for students.

Reference photos 13.3A Generated images — two stages for Korean media art

a
Museums — where collection · conservation · criticism follow. Selection is by text and photos

b
Outdoor festivals and city screens — a low threshold and big audiences. Where students can step up first

Institutions

Nam June Paik Art Center

Yongin

- 283 collection works, 2,285 video archive items
- 2026.7–2027.2 1st Nam June Paik Media Art Festival, 20 years after his death, "Nam June Paik's Planet" — unveils the 1990s "Planet" series

MMCA

Gwacheon's 40th anniversary

- 2026 exhibition "Imaginations of Light"
- First release of 100,000 of some 520,000 digital archive items (incl. the Paik archive)
- New conservator training program, including new media

Seoul Museum of Art

Seoul Mediacity Biennale (2000–)

- 2026: Lynn Hershman Leeson's first museum solo show in Asia; a sound art exhibition
- Seo-Seoul Museum of Art — preparing to open with a new-media collection and a youth studio

Art Center Nabi

Since 2000

- June 2026: reopening in its own building in Sagan-dong, Jongno-gu

TIP

The calls state that screening hours may change under energy-saving policy. These are not 24-hour screens.

City screens — where students can stand first

Much of the work on Seoul's city-run public media art platforms is selected through open calls for emerging artists. The threshold is lower than a museum's, and you get to see your work screened in real urban space.

Platform	Location	Hours
Seoullo Media Canvas	Mallijae-ro, Jung-gu (near Seoullo)	19:00–23:00
Atelier Gwanghwa	Sejong Center facade	19:00–23:00
Haechi Madang Media Wall	Gwanghwamun Stn. Exit 9 ramp	08:00–22:00
Ogansugyo Media Facade	Under Ogansugyo, Cheonggyecheon	18:00–23:00
Atelier Nodeul	Nodeul Island	Varies by show

What recent exhibitions show

Here are the 2025–2026 trends by institution and program. Titles and dates change yearly, so check the institutions' websites, but learn which doors are where.

Seoul Museum of Art

Branches and Mediacity

- 2025: Seoul Museum of Photography opens; media-focused branch Seo-Seoul Museum of Art in the works — as branches grow, media · photography · performance each get a home of their own
- 13th Seoul Mediacity Biennale (2025.8, Seosomun main building)
- Buk-Seoul Museum of Art Title Match 2025 — duo show of YOUNG-HAE CHANG HEAVY INDUSTRIES and Hong Jinhwon

MMCA · Nam June Paik Art Center

Origins and conservation

- Gwacheon's "The More, the Better," back on after restoration, became the textbook case of media art conservation
- 2026, 20 years since Paik's death — the Art Center's 1st Nam June Paik Media Art Festival (opens in July), a shamanic gut performance moving from Gwacheon to the Art Center

DDP Seoul Light

City-scale facades

- Fall 2025 (8.28–9.7) — media facades by d'strict, Laurent Grasso and others on DDP's exterior, plus laser · kinetic installations; free night viewing
- Held alongside, the forum 'New art that AI technology will create' explored where generative tools meet facade work

Gwangju Media Art Platform G.MAP

UNESCO City of Media Arts

- Gwangju, designated in 2014, is Korea's only UNESCO City of Media Arts; G.MAP is the hub of local media art
- After its 2024 10th-anniversary show, runs creator-support programs such as Digital Art Culture Lab · Project Lab

Busan · regional festivals

Fairs and outdoors

- LOOP Lab Busan 2025 (4.24–6.29) — Korea's first international media art fair · exhibition, by Busan Museum of Art and LOOP Barcelona, at 26 city venues incl. F1963
- Korea Heritage Service 'National Heritage Media Art' (2025) — night projections and interactive installations in 8 cities, incl. Daereungwon in Gyeongju and Jinjuseong Fortress

What it means for students

Three kinds of doors

- Museums · biennales — judged on text and documentation photos; long cycles
- City facades · festivals — open calls, fixed specs, big audiences
- Regional platform labs — gear and mentoring provided; good for a first installation

Immersive exhibitions

5.4 million

Cumulative visitors to d'strict's ARTE MUSEUM (to 2023.8). Permanent venues in Korea and abroad, incl. Jeju · Gangneung · Yeosu

About 4,800 m²

The ninth permanent venue, Manhattan, New York, opened September 2025. About 134,000 visitors in three months

This industry also provides the most jobs for media art graduates. Its nature is debated, though; see section 13.8.

> Before aiming for a museum show, get onto a city screen once. That record backs your next application.
>
> 13.3 The media art landscape in Korea today

Exercise
13.3

Task	Choose one of Seoul's public media art platforms and plan a 30-second piece that fits its screen specs and screening conditions. Make a one-page proposal and a storyboard.
Tip	Check the resolution and length in a real open call and work to those numbers. Practicing to a call's specs is the real thing.
Assessment	Does it reflect the specs and site conditions? Does it consider the surroundings at screening time (night, pedestrians)?
Model answer	A plan that tuned brightness and pace to the day-night light difference, pedestrian walking speed and even the surrounding signs.

PART 13 Media art and expanded cinema

13.4 Tool map

What do you make it with? An editing tool produces one fixed output, but media art tools usually make 'a program that keeps running in real time.' You design for operation, not completion.

Note

Sensors and code — media art tools make not a finished product but a program that keeps running

Structure

Read interactive media art in three boxes: sensor input (camera · depth · mic · touch) → processing (TouchDesigner · Unity · p5.js) → output (projection · LED · sound). The tool map below follows the same order.

Tools that make real-time video

Processing

- **TouchDesigner** — Wire nodes together to make real-time video. Links sensors · sound · video · projection output in one window; the most widely used tool for exhibitions, free under a non-commercial license
- **Unreal Engine · Unity** — Game engines. 3D space, VR · AR, virtual production. Camera and lighting concepts carry straight over
- **Processing · p5.js** — Drawing with code. Generative basics; p5.js runs right in the browser, the lowest barrier to entry
- **Max/MSP · Pure Data** — Sound and signal. For sound-led or sound-reactive work

Tools that take input

Input

- **Depth camera** — A person's distance and pose. The basic input for motion-reactive work
- **LiDAR** — Scans space as points. Position tracking in large spaces, turning space into data
- **Arduino · Raspberry Pi** — Small computers that run sensors and motors. Read light · sound · distance · pressure and turn it into video
- **Webcam and video analysis** — One camera for motion detection, contour extraction, face tracking. The most realistic option with no budget

Tools that send output

Output

- **Resolume** — Plays and mixes video live. The standard for concert and club visuals
- **MadMapper** — Dedicated to projection mapping. Fits video onto surfaces that aren't flat
- **NDI · Syphon** — Channels for passing video between programs in real time. Essential once you have several machines

TIP

Don't pick the tool first. Write in one sentence 'what happens when the viewer does what,' then choose, and your options shrink to two or three.

Reference photos 13.4A Generated images — three kinds of output: data, sound, motion

a Data to screen — start with p5.js and CSV, then move to live APIs

b Work with sound as output — Max/MSP · Pure Data, directional speakers

c Work with motors as output — Arduino ties sensors to motors

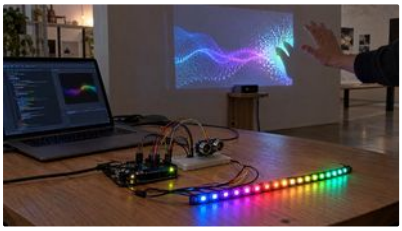
From goal to tool

What you want	Fastest route	Next step
React to viewer movement	Webcam + TouchDesigner	Depth camera · LiDAR

What you want	Fastest route	Next step
Screen that reacts to sound	Mic input + TouchDesigner	Refine analysis with Max/MSP
Put video on buildings · objects	MadMapper	Multiple projectors · blending
Make patterns with code	p5.js	Processing · GLSL shaders
Experience 3D space	Unity	Unreal · VR headset integration
Data to screen	p5.js + CSV	Live API integration

> Don't pick the tool first. Write in one sentence what happens when the viewer does what, then choose, and your options shrink to two or three.
>
> 13.4 Tool map

Three kinds of media art tools — input · generation · output



Microcontroller kit — sensors change the image

Send distance · sound · pressure sensor values over USB/OSC and map them to video parameters. The viewer's body becomes the input

Node-based visual programming

Link boxes with wires to make real-time graphics — TouchDesigner · vvvv · Max family. Data → video without code

Media server · VJ software

Stack clips in layers and fire them on the beat — Resolume · MadMapper family. The on-site standard for projection mapping and LED output

How the three split the work — The kit does **input** (sensors), the node tool **generation · processing** (real-time graphics), the media server **output** (projector · LED mapping). A small show does all three in one node tool; a large one splits them.

Figure 119 Media art tools — sensor kit, node-based tool, media server. Unlike video production, it is about "real-time generation," not "playback."

Exercise 13.4

Task Make the simplest possible piece in which the screen responds to one viewer gesture. Use only a webcam and free tools. Write the response rule in one sentence before you start.

Tip Keep the rule as simple as you can. One line like 'it brightens when someone comes close' is enough.

Assessment Do viewers get the rule without explanation? Does it run 10 minutes without stopping?

Model answer A piece with a single rule that tuned the speed and afterglow of the response to feel 'alive.'

PART 13 Media art and expanded cinema

13.5 Making it work in the gallery

Working in the studio and working every day for a month in a gallery are entirely different problems. A media artwork's reputation usually turns not on polish but on 'was it ever off?'

Note

LED mirror room — it repeats hundreds of times a day and must stay on all month. Operation is part of the work

Light and distance

1/4

Brightness when screen area quadruples. Brightness is rated in ANSI lumens; the same output looks dimmer on a bigger screen

About 3m

Distance needed for a 2-meter-wide image with a 1.5 throw-ratio lens. Measure the space first, then choose the lens

- **Ambient light** — In a brightly lit gallery, black lifts to gray. If dark areas matter, make light control a condition of the show.
- **Surface** — A white wall is safest, but texture costs resolution. A dark surface deepens blacks but darkens everything.

Note

Screen savers, sleep mode and automatic updates are the most common causes of reboots during a show. Turn them all off.

Keeping it running

01 **Auto-start** — When the power comes on, the program should launch itself with nobody there. OS auto-login and startup registration are the basics.

02 **No power saving** — Turn off screen savers, sleep mode and automatic updates.

03 **Scheduled restart** — Have it restart once every day before opening, and errors won't pile up.

04 **Backup version** — Also export the work as a plain video file. If the real-time piece stops, you can at least play that.

What to bring on site

Item	Why
Power strips, extension cords	There are never enough outlets
Spare video cables	Bad cables are the most common failure on site
Adapter kit	Every device has different ports
Black tape · cable ties	Needed for both safety and looks
Install photos and settings notes	Lets you reproduce it exactly at the next show
Printed work label	On-site labels are often late

Safety and liability

01 **Cables** — Keep cables out of visitor paths. If unavoidable, use covers.

02 **Brightness and flashing** — Rapid flashing can trigger seizures in some viewers. Avoid more than three flashes in 1 second, and if there are any, post a notice at the entrance.

03 **Sound** — Set volume and direction so you don't affect neighboring works. Consider directional speakers or headphones.

04 **Cameras and privacy** — If the work captures viewers on camera, state whether it records; if it doesn't store footage, say so.

> Design for the last day of the show, not the first. Still running a month later is part of the work.
>
> 13.5 Making it work in the gallery

Exercise
13.5

Task	Assume you are installing your work in a hypothetical gallery (6 meters wide, 4 meters deep, 3 meters high) and prepare an installation drawing, equipment list and operation plan.
Tip	Calculate the throw distance and image size and write down the numbers. Always mark power locations and cable routes on the drawing.
Assessment	Are the numbers calculated? Is there a plan for failures?
Model answer	An operation plan written day by day, including auto-start, daily restarts and a backup video.

PART 13 Media art and expanded cinema

13.6 Artwork statements and portfolios

In media art, writing is part of the work. Viewers read the statement to understand the piece, and open calls and residencies are judged on text and photos alone. The demands differ from a video portfolio, so practice separately.

Anatomy of a statement

01	02	03
What it is	How	Why
Start with 'This work is ...' Open with background and nobody reads to the end	What happens when the viewer does what. The user manual for an interactive work	The reason it must take this form. Grounds for a choice, not a tech showcase

TIP

Gallery wall texts of 150 to 300 characters get read. Any longer and nobody stands there reading.

Words to avoid

- **Vague big words** — 'existence', 'relationship', 'boundary' used without explanation say nothing at all. If you use one, state concretely, at least once, what it refers to in this work.
- **Listing tech** — tools belong in the materials line. Showing off tools in the statement makes the work look small.
- **Unverified quotations** — don't quote books you haven't read. It's the first thing jurors ask about.

What goes in the portfolio

Item	Content	Common mistake
Key images	1 installation view, 2 details	Screen captures only
Documentation video	1–2 min, including audience reactions	Long footage of the screen alone
Materials line	Medium, dimensions, duration, year	Left out entirely
System diagram	1 input-processing-output flowchart	Explained in words only
Installation requirements	Space, power, blackout needs	Jurors can't tell if it can be installed
Contribution	Your share of a collaboration	Team work made to look solo

Documentation keeps the work alive

A media art work vanishes when the show closes. Only the documentation remains, and the next open call and the next exhibition are decided by it. During the show, be sure to shoot installation views, details, real audience reactions, and even the installation process.

> The most important day in the gallery is not opening day but the day you shoot documentation.
>
> 13.6 Artwork statements and portfolios

Exercise 13.6

Task For one of your works, write a 250-character exhibition statement and make a one-page portfolio. Include the materials line, system diagram, and installation requirements.

Tip Once it's written, have someone who doesn't know the work read the statement, and ask if they can tell 'what they're meant to do'.

Assessment Does the first sentence define the work? Are the installation requirements specific enough for jurors to judge?

Model answer A layout that sets audience-reaction photos beside the system diagram, so one page explains both what you see and how it works.

PART 13 Media art and expanded cinema

13.7 Open calls and grants

How to actually apply. Media art costs more than video production in equipment, space, and installation, so open calls and grants become a precondition for the work. The list below follows actual 2026 notices; amounts and dates change every year, so always confirm them in the official notice.

Korean open calls students can enter now

Open call	Organizer	Deadline (2026)	Awards
Dream Big Art Award	DB World	Sep	KRW 120 million total; separate student category
JoongAng Media Art Competition	JoongAng Ilbo	Aug	KRW 45 million total; separate student category
Seoul National Cemetery Media Art	Ministry of Patriots and Veterans Affairs	Aug	Grand prize KRW 30 million
Seoullo Media Canvas emerging artists	Seoul City	Aug	20 teams, KRW 1.5 million each + exhibition
Seoul Light Gwanghwamun	Seoul City	Nov	6 teams, KRW 12 million
NEXT:ON Incheon	Incheon Technopark	Aug	3 teams, KRW 25 million each

Dream Big and JoongAng run separate student categories. That means you aren't up against working artists, so look first at calls with a student category.

Note

Dream Big's student prize is paid as a scholarship through your university; if the university can't pay it out, the award may be canceled. Check with your department before applying.

Residencies · incubation · public grants

Gwangyang Media Art Residence

May deadline

- Media art only, 3 artists selected
- Stipend of KRW 1.6 million a month × five months, studio and housing

G.MAP Digital Art Culture Lab

August deadline

- Gwangju, 14 teams, 18 mentoring sessions plus equipment · space
- All team members 19 or older

MMCA Residency

A goal a few years out

- Goyang 25 or older, Changdong 40 or older
- All fields incl. new media, nearly 1 year in residence

K-Art Young Creators Support

Applications in March

- New 2026 Ministry of Culture, Sports and Tourism program: KRW 9 million a year to 3,000 people aged 39 or under
- Media art isn't listed as its own field, so look at the interdisciplinary category

Art Korea Lab

Staged support

- Follow-up support after the main program (15 grants, KRW 30 million each)

Seoul Foundation for Arts and Culture

Seoul Convergence Art Festival

- Premieres new work by selected artists
- The route taken by the 2023 Ars Electronica winners

Going international

Name	Organizer · venue	Deadline	Prize
Prix Ars Electronica	Linz (Austria)	Mar	€10,000 per category
STARTS Prize	European Commission	Mar	€20,000 each, 2 categories
Lumen Prize	UK	May	$30,000 total; entry fee
SIGGRAPH Art Gallery	USA	Jan	No prize; exhibition
ISEA	Host city changes yearly	Dec	No prize; academic presentation
VH AWARD	Hyundai Motor Group	Jul	Production support + residency

At the 2023 Prix Ars Electronica, two Korean artists won the top prize and a special prize. Both had been selected for Korean public grants several times, and one debuted at a Korean convergence arts festival. The route from Korean open calls through Korean festivals to the international stage really works.

Four things worth making in one semester

01	02	03	04
Artist statement in Korean, 500 words	**English proposal, 3 pages**	**30-second highlight video**	**3-minute portfolio film**
Most Korean calls require a work description	Required by VH AWARD and ISEA. 11 pt, PDF is standard	JoongAng Media Art Competition asks for 20–30 s at application	VH AWARD asks for up to 3 minutes

> Pin the calendar of open calls to your desk, not a single deadline. March, May, July, August, September, and November are the deadline months for Korean media art.
>
> 13.7 Open calls and grants

Exercise 13.7

Task	Pick three of the calls above that suit you and put the documents each requires into a table. Plan to actually apply to one of them, and write out a schedule working back from the deadline.
Tip	Work backward from the deadline. Write down how many days you need for video production, paperwork, review, and submission.
Assessment	Were the required documents checked in the notice itself? Is the schedule realistic?
Model answer	A plan that targets a Korean and an international call with the same work, preparing Korean and English documents together.

PART 13 Media art and expanded cinema

13.8 Three debates

Immersion, AI, preservation. Study media art and you will run into three debates. None has a settled answer, so the goal is to know the grounds of each position and decide where you stand.

Debate one — immersive exhibitions: art or product

The product view

- One Korean study defines immersive exhibitions as 'commercial content aimed at the immersive experience itself, beyond mediating art'
- Admission — immersive shows abroad charge adults tens of thousands to over a hundred thousand won; Korean public museums mostly around KRW 10,000
- An industry CEO admits — 'anyone can take on a theme like waves, so borrowed ideas and copyright infringement are hard to prove'

The necessity view

- When everything can be watched at home, immersive experience gives people a reason to show up in person
- Public museums are absorbing it too — MMCA's 2026 exhibition on light, the Seoul Museum of Art's new-media branch

A question to consider

Is a work made on a KRW 1.5 million budget and shown four hours each evening on a city screen the same media art as a ticketed venue drawing millions a year? What divides them: the medium, the source of money, or where the audience stands?

Term

Two strands of authorship — work that uses AI as a tool differs from work that takes AI itself as its subject. It is the difference between using a tool and questioning it.

Debate two — generative AI and authorship

The 2024 gap

There were no rules

- A generative AI entry won the grand prize in a public-service ad contest, then sparked controversy
- The organizer said 'with no AI clause, we can neither block nor encourage it', and the award stood

The 2026 shift

Disclosure, not bans

- JoongAng Media Art Competition — AI assistance encouraged, heavy use judged in a separate category, use and scope must be disclosed
- Veterans Affairs ministry call — asks for tools used · scope · even reference sources
- An international conference's art track — stating AI's role is mandatory

Work that questions the tool

2026 Korea Artist Prize finalist

- Restores a 1946 film with AI, revealing that 'technology cannot fully restore history'
- Examines the biases built into video-generation models

In 2 years, 'AI use: no rules' became 'AI use: must be declared.' The habit of logging in your production journal which tools you used, where, and how much becomes your submission paperwork.

Debate three — how a work survives

737 units

Damaged CRTs in the restoration of *The More, the Better*, repaired or replaced with used parts

266 units

Small monitors at the top, replaced with flat displays that keep the original look. Eight videos converted to digital

4 days a week, 2 hours

Operating time since the September 2022 restart, to protect the work

— **The open question** — is *The More, the Better*, with its CRTs swapped for flat screens, still the same work? Conservation guidelines divide installations into cases where 'the equipment is part of the work itself' and where it is 'used only to show the work.' In the first case, replacing equipment means changing the work.

— **What students can do now** — document the software and versions, hardware, settings, and 'what may change and what must not,' and the work can be restaged years later.

— **Preservation as a career** — in 2026 MMCA opened a training program for conservators, new media included. Not only making work but keeping it is becoming a profession.

> On the day you finish a work, write a one-page tech spec. That sheet becomes the key to switching the work back on 10 years later.
>
> 13.8 Three debates

Exercise 13.8

Task	Choose one of the three debates and write a 1,000-character opinion piece. Present the grounds of each side, then state your position and give your reasons.
Tip	Find and write down the arguments against your position first. If you don't know the counterarguments, your own position is weak too.
Assessment	Are both sides' grounds presented fairly? Does the conclusion come with reasons?
Model answer	An essay that draws on the writer's own work to turn an abstract debate into a concrete case.

PART 13 wrap-up

One-page summary

13.1 What media art is	An attitude, not a genre. Just check that you can say in one sentence why it has to be this medium.
13.2 How video and media art differ	The premises differ, not the technology. Viewers walk in midway, so design the loop and entry points, and respect the aspect ratio.
13.3 The Korean media art landscape	Three strands: institutions · city screens · the immersive industry. Students get onto city screens first and build a track record.
13.4 A map of tools	Split it into processing · input · output. Write what happens when the viewer does what, then choose tools.

13.5 Making it run in the gallery	Calculate throw ratio and brightness, and keep it running to the last day with auto-start · sleep disabled · daily restart · a backup copy.
13.6 Statements and portfolios	What · how · why, in 150–300 characters. Don't leave out the materials line · system diagram · installation requirements · contribution, and shoot documentation.
13.7 Open calls and grants	Start with calls that have a student category. In one semester, prepare all four: Korean artist statement · English proposal · 30-second highlight · 3-minute film.
13.8 Three debates	The nature of immersive shows, disclosure standards for AI, discontinued parts and preservation. Know each side's grounds and decide where you stand.

MEMO · PART 13

What you open in this PART

1. Pre-shoot · shoot-day · delivery checklists
2. Glossary and Korean-English term table
3. Course plan · production schedule templates · worksheets

Appendix

The appendix is not for reading but for opening. At specific moments, such as the day before a shoot, right before delivery or the night before an interview, open the relevant page and check what's on paper, item by item, instead of relying on memory.

Photo OPEN-14 PART divider, full-page photo · generative image

Appendix Field documents

A Pre-shoot equipment checklist

Even seasoned DPs forget batteries. Only what's on paper gets done.

TIP

Check twice: the night before you leave and right before you go.

☐	Category	What to check
☐	Camera	Battery charge and spares, spare memory cards and format status
☐	Camera	ND filters, tripod, manual exposure · manual white balance set
☐	Audio	External mic, lavalier (pin) mic, recording level check
☐	Lighting	Light stands and sandbags, reflector, power and power-strip capacity
☐	Data	2 backup drives, a laptop to verify copies
☐	Documents	Storyboard, shot list, shooting schedule (call sheet), talent releases, location permits
☐	Consumables	Tape for securing cables, slate, pens

Appendix Field documents

B Running the shoot day

Decide in advance who checks what at each stage of the day.

☐	Time	Main activity	In charge	Checks
☐	2 hours before	Check gear and charge levels	Production	Batteries, cards, backup ready
☐	1 hour before	Set up the location, rig lights	Camera, lighting	Secure power, rig safely
☐	30 min before	Rehearsal and test shots	Director	Exposure, white balance, audio levels
☐	During the shoot	Shoot and log cut by cut	Script supervisor	Take numbers, mark OK cuts
☐	Between cuts	Back up data, swap batteries	Production	Format only after copies are verified
☐	Before wrap	Get room tone and extra inserts	Director	Final check for missing cuts
☐	Wrap	Collect gear, restore the location	Everyone	Lost items, trash, damage

Must-check before calling a wrap

Is every cut on the storyboard checked off? If even one is blank, don't pack up.

Appendix Field documents

C Media management and backup

Checking file size alone won't catch corrupted files.

The 3-2-1 rule

3 copies, 2 different media, 1 in a physically separate place.

☐ Principles
☐ Make at least 2 copies on shoot day
☐ Copy the moment a card fills. Never format before the copy is complete
☐ Check playback after copying
☐ Never use final · really_final · revised in file names. Use only the v01 v02 format and dates

Folder structure and naming rules

Folder	Naming example	Description
01_FOOTAGE	D01_C01_T02.mov	Shoot day / cut / take
02_AUDIO	D01_SC01_ROOMTONE.wav	Room tone kept apart from dialogue
03_GRAPHICS	LOGO_3D_v03.aep	Version number required
04_MUSIC	BGM_main_licensed.wav	License status in the file name
05_EXPORT	AD15_v05_20260315.mp4	Version and date
06_DOCS	PPM_final_signed.pdf	Keep approval documents

Appendix Field documents

D Safety and legal checklist

Accidents and disputes can only be stopped before the shoot.

Note

Drone flight rules and filming-permit procedures vary by area and over time. When you plan,

☐ Area	What to check
☐ Electrical safety	Check power-strip load, keep lights away from flammables, never operate with wet hands, tape down cables across walkways
☐ Equipment safety	Sandbags on every light stand, double-secure gear mounted high, tripod legs fully spread

check the latest requirements of the relevant authority yourself.

☐ Area	What to check
☐ Cast and crew safety	Breaks on long shoots, minimal waiting under hot lights, no dangerous stunts
☐ Drone operation	Check permitted airspace, get prior approval, no flying over crowds, confirm pilot certification
☐ Likeness rights	Written talent releases, blur bystanders' faces, guardian consent for minors
☐ Locations and trademarks	Get location permits, control other brands' logos and signs in frame, clear rights for music playing indoors

Appendix Field documents

E Post-production and delivery checklist

Check twice: before you hit export and before you send.

☐ Post-production checks	☐ Delivery checks
☐ Color and brightness matched across all cuts	☐ Matches required specs (resolution, fps, codec)
☐ Composited elements have grain and shadows	☐ Running time exact
☐ Captions checked for typos and spelling	☐ File-naming rules followed
☐ Captions inside the safe area	☐ Playback checked on another device
☐ Even loudness, no peaks	☐ Music and font license proof attached
☐ No black frames left at head or tail	☐ Project files and sources backed up

Final check methods

Method	What it checks
Play on a smartphone	Caption and logo legibility on a small screen
Play muted	Message gets across without sound
1 screening for a first-time viewer	They can say at once what it's about
Play at 1.5x speed	Spot where the rhythm drags
Play in black and white	Check contrast and how the eye is led

Appendix Field documents

Glossary of video terms

Key terms from the text, in Korean alphabetical order.

Term	Meaning
Garbage matte	Masking out unneeded areas before keying
Gamma	Value that adjusts midtone brightness
Gain	Highlight brightness, or the amount of signal amplification
Grain	Noise that mimics film grain
Dynamic range	Range of brightness that can be recorded
Dissolve	Transition in which two images overlap
Log	Recording that compresses a wide brightness range
Rotoscoping	Tracing outlines frame by frame to separate a subject
Lookup table (LUT)	Color conversion table
Room tone	Recording of a location's silence
Lead room	Space ahead of a moving subject
Master	Final original file
Matchmoving	Recovering camera motion to attach 3D elements
Mise-en-scène	Arrangement of everything in the frame
Backlight	Light from behind the subject that outlines it
Bokeh	The look of out-of-focus blur
Safe area	Part of the frame that won't be cut off
Shutter angle	Per-frame exposure time expressed as an angle
Spill	Key color bleeding onto the subject
Sequence	A group of scenes serving one purpose
Ambisonics	A 360-degree spatial audio recording format
Establishing shot	Opening cut that shows where a scene is and what's going on
Overcranking	High-speed shooting, for slow motion
Insert	Supporting cut showing a detail up close
Jump cut	Cut that skips time within the same framing
Lighting ratio	Brightness ratio of key light to fill light
Coverage	How fully a scene is shot in various sizes and angles
Continuity	Consistency from cut to cut
Chroma subsampling	Compression that records reduced color information
Keyframe	Marks the point where a value changes
Timecode	Position written as hours:minutes:seconds:frames
Track matte	Cuts out a layer using another layer's shape

Term	Meaning
Phi phenomenon	The brain filling the gaps between still images with motion
Proxy	Lightweight stand-in file for editing
Precompose	Groups several layers into one
Fill light	Secondary light that controls shadow depth
Headroom	Space above the head
White balance	Setting the color-temperature reference

Appendix Field documents

Keyboard shortcuts

Tape this next to your monitor until your hands remember.

Premiere Pro

Shortcut	Function	Shortcut	Function
V	Selection tool	C	Razor tool
B	Ripple edit	N	Rolling edit
I / O	In point / out point	Space	Play and stop
Q / W	Ripple trim previous / next	M	Add marker
Ctrl+K	Cut at playhead	Shift+Delete	Ripple delete
J / K / L	Reverse / stop / play	Arrow keys	Step 1 frame
Ctrl+M	Export	Ctrl+S	Save

After Effects

Shortcut	Function	Shortcut	Function
P	Position	S	Scale
R	Rotation	T	Opacity
U	Show keyframed properties only	UU	Show all modified properties
Ctrl+Shift+C	Precompose	Ctrl+D	Duplicate
[/]	Move layer start / end	Alt+[/]	Trim layer
F9	Apply Easy Ease	Ctrl+Alt+H	Graph Editor
Ctrl+M	Add to Render Queue	Space	Preview

Appendix Field documents

H 15-week course plan

The standard order for covering the whole book in one semester. Open the appendix during the shooting week, week 11.

Week	Topic	PART	Exercise
1	Orientation and the history of video	PART 12	Analyze 3 references
2	Visual language and 8 shot types	PART 1	Shoot one person in 8 sizes
3	Angle, composition, eyeline	PART 1	Composition exercise and comparison
4	Camera and exposure	PART 3	Exposure triangle exercise
5	Resolution, frame rate, aspect ratio	PART 3, 7	Make versions for each spec
6	Lighting design	PART 4	3-point lighting and key light exercise
7	Sound and chroma key	PART 4	Recording exercise, shooting for keying
8	Midterm presentation	PART 2	Present proposal and concept
9	Proposal and storyboard	PART 2	Draw a 6-cut storyboard
10	Running the PPM	PART 2	Submit PPM document
11	Shooting week	PART 3, Appendix	Principal shoot and backup
12	Editing and color grading	PART 5	Submit rough cut
13	After Effects compositing	PART 5	3D titles and keying
14	Platform versions and distribution	PART 8	Vertical version, captions, hashtags
15	Final screening and critique	PART 10	Submit final cut and portfolio

Appendix Field documents

I Image-generation prompt guide

Style rules to keep consistent when making plates for the [Figure] slots in the text with image-generation tools.

Overall style **Flat textbook-style vector** • flat vector textbook illustration	Background **Ivory or white** • ivory background or white background
Main accent **Vermilion orange** • vermilion accent	Secondary color **Deep teal** • deep teal secondary accent
Line weight **Thin and even** • thin uniform line weight	Text **None** • no text, no lettering
People **Silhouettes or neutral figures** • neutral silhouette figure	Ratio **Landscape diagrams 16:9, people comparisons 4:3** • aspect ratio 16:9 or 4:3

Cautions when making plates

- Text inside generated images usually comes out garbled. Add any text yourself at the editing stage.
- For plates with people, ask for silhouettes or neutral forms so they don't look like real people.
- Don't ask for frames from specific films or ads to be recreated. That breaches both copyright and ethics.
- Check the tool's terms for commercial use, and review the license scope before printing and distribution.
- For print, work out the resolution needed at 300dpi, then upscale.

Appendix Field documents

References and sources

The figures and standards in the text draw on public sources in the categories below and on industry practice.

On sources

Technical specs and platform policies change often. Always check the latest official documents before production and delivery. Work by the directors and studios cited is mentioned only to analyze technique, and no frames have been reproduced.

Theory and history

From perception to lighting manuals

- Classic psychology literature on apparent motion and the phi phenomenon
- Film history surveys and introductions to film theory (montage theory, classical editing grammar)
- Translations of original Soviet montage texts (Kuleshov effect, collision montage)
- Cinematography and lighting manuals (3-point lighting, lighting ratios, portrait lighting patterns)

Technical standards

Standards and manufacturer documents

- International broadcast and cinema standards (resolution, frame rate, color space)
- Camera makers' official manuals and white papers
- Official Adobe Premiere Pro and After Effects help
- Official Blackmagic Design DaVinci Resolve manual
- LED display makers' spec sheets (pixel pitch, luminance, refresh rate)

Platform guides

Each service's official guidance

- YouTube Creator Academy and official Help Center guides
- Ad spec documents in the Meta Business Help Center
- TikTok Creator Portal and Business Center guides
- Naver's official search and blog guides

Industry and law

Statistics · copyright · contracts

- Korea Creative Content Agency industry statistics and surveys
- Korea Broadcast Advertising Corporation ad market data
- Korea Copyright Commission advice and guidance materials
- Drone rules from the Ministry of Land, Infrastructure and Transport and relevant authorities
- Ministry of Culture, Sports and Tourism standard contract forms

Appendix Field documents

Exercise worksheet forms

Print and use as is. In class, photocopy and hand out; for self-study, redraw them in your notebook.

TIP

☐	Worksheet	Form
☐	1	One-page proposal form

A semester's stack of filled-in worksheets is in itself a full record of your work.

☐	Worksheet	Form
☐	2	Shot list form
☐	3	6-panel storyboard form
☐	4	PPM checklist form
☐	5	Reference cut analysis sheet
☐	6	Portfolio self-check sheet

Appendix Field documents

50 common mistakes

Skim this once the day before a shoot and once right before delivery. Most failures come not from a lack of talent but from steps nobody checked.

Planning stage

01 Starting to plan before choosing a platform

02 Packing in two or more messages

03 Targeting everyone

04 Taking only the feel of references without breaking them down

05 Clinging to ideas that don't fit the budget and schedule

06 Going into the shoot without drawing a storyboard

07 Not designing space for captions and logos

08 Going ahead on team agreement alone, without a PPM

09 Not securing talent releases and location permits

10 Looking into music licenses after the shoot

Shooting stage

11 Shooting on auto exposure and auto white balance

12 Using shutter speed to control exposure

13 Shooting wide open in daylight without ND filters

14 Not getting a master shot and inserts

15 Shooting without checking the 180-degree rule

16 Shooting many cuts at the same size and angle

17 Recording main audio on the camera's built-in mic

18 Not recording room tone

19 Bringing batteries and memory cards with no spares

20 Formatting cards mid-shoot without a backup

21 Leaving light stands without sandbags

22 Standing talent right up against the chroma-key backdrop

23 Wardrobe that matches the backdrop color

24 Other brands' logos showing in frame

25 Packing up without checking every storyboard cut was shot

Editing and post-production

26 Cutting picture first, without music

27 Making every cut the same length

28 Cutting after the action ends

29 Putting a transition on every cut

30 Placing captions outside the safe area

31 Not proofreading captions

32 Handing over with color that varies cut to cut

33 Leaving composites without shadows and grain

34 Audio levels jumping around from section to section

35 Black frames left at the head and tail

36 Editing 4K natively without proxies until it freezes

37 Naming files final, really_final

38 Linking sources outside the project folder

39 Checking color on only one monitor

40 Not checking proper nouns in auto-captions

Delivery and publishing

41 Exporting without checking the required specs

42 Not checking playback on other devices

43 Not checking with the sound off

44 Making the vertical version by just cropping the horizontal

45 Forgetting that the first frame is the thumbnail

46 Rushing the title at the last minute

47 Using only massive hashtags

48 Not checking metrics after posting

49 Not checking portfolio link permissions

50 Not backing up project files and sources

> Avoid even half of these 50 and the quality of your work changes visibly.
>
> Appendix P 50 common mistakes

Appendix Field documents

On-set terms

The words actually used on set. If you can't follow them, you get fewer chances to learn.

Rules of set language

Term	Meaning	When it's used
Roll	Signal to start rolling	Roll sound, then roll camera

Speak briefly and clearly. When you get an instruction, always repeat it back. Instructions you pretended to understand cause the worst accidents.

Term	Meaning	When it's used
Cut	Signal to stop	Only the director calls it
OK	Take approved	Script supervisor logs it
Keep	Hold for now	Borderline, but not discarded
NG	Failed take	Shoot again
Take	Each repeat of a shot	Take 3, here we go
Slate	Board showing cut info	Sync reference point
Standby	Ready and waiting	Quiet, everyone
Rehearsal	Run-through without recording	Check blocking and timing
Setup	Installing and adjusting gear	Camera setup, lighting setup
Move	Camera movement	Move, here we go
Tighter	Frame closer	Framing cue
Looser	Frame wider	Framing cue
Eyeline	Height and direction of a subject's gaze	Match the eyeline, please
Headroom	Space above the head	Too much headroom
Boom in shot	Mic visible in frame	Reshoot right away
Pin	Lavalier mic	Pin them up, please
Bounce it in	Bouncing light onto the subject	Softens shadows
Kill	Turn a light off	Kill that light
Coverage	How many sizes you've secured	Not enough coverage
Let's grab an insert	Shoot a close detail cut	Gives the edit room
One more	Once more	Add a take
Check	Review the footage	Play back on the monitor
Wrap	Pack up gear and restore	Includes restoring the location

Appendix Field documents

Korean-English term table

A basic table for reading international sources or making an English resume and showreel.

Korean	English	Korean	English
Gihoek	Planning / Development	Yeonchul	Directing
Gihoek uido	Concept Statement	Sinopsiseu	Synopsis
Sinario	Screenplay / Script	Konti	Continuity
Seutoribodeu	Storyboard	Aenimaetik	Animatic
Chwaryeong gamdok	Director of Photography	Joyeonchul	Assistant Director

Korean	English	Korean	English
Jomyeong gamdok	Gaffer	Chwaryeong bojo	Camera Assistant
Misul gamdok	Production Designer	Sopum	Props
Pyeonjipja	Editor	Saekbojeong	Color Grading
Hapseong	Compositing	Mosyeon geuraepik	Motion Graphics
Syot saijeu	Shot Size	Keullojeueop	Close Up
Bugam	High Angle	Anggak	Low Angle
Yeokgwang	Backlight	Jugwang	Key Light
Bojogwang	Fill Light	Bansapan	Reflector
Simdo	Depth of Field	Nochul	Exposure
Hwaiteu baelleonseu	White Balance	Saegondo	Color Temperature
Peureim reiteu	Frame Rate	Haesangdo	Resolution
Hwamyeonbi	Aspect Ratio	Anjeon yeongyeok	Safe Area
Gapyeonjip	Rough Cut	Choejongbon	Final Cut / Master
Nappum	Delivery	Sujeong	Revision
Yesan	Budget	Gyeonjeok	Quotation
Seoboe	Casting / Booking	Rokeisyeon heonting	Location Scouting
Chwaryeong iljeongpyo	Call Sheet	Hyeonjang	On Set
Churyeon dongeuiseo	Talent Release	Jeojakgwon	Copyright
Poteupollio	Portfolio	Ril	Showreel / Demo Reel

Standard production schedule templates

A schedule is a tool, not a promise. You make it so you can tell what slipped when things go off course.

TIP

Log the actual time each step takes, and your next project's quote will be more accurate.

15-second ad (3 weeks total)

☐	Day	Stage	Deliverable
☐	D-21	Take the brief, research	10 references, research notes
☐	D-18	Develop concepts	3 one-sentence concepts
☐	D-15	Submit proposal	12-item proposal
☐	D-12	Draw storyboard	6-cut storyboard
☐	D-9	Test with an animatic	Timing check version
☐	D-7	PPM meeting	Approved PPM document

☐	Day	Stage	Deliverable
☐	D-5	Location scouting	Scouting photos, floor sketch
☐	D-2	Gear check and rehearsal	Equipment checklist
☐	D-DAY	Shoot	Camera originals, 2 backups
☐	D+1	Rough edit	Rough cut
☐	D+3	Compositing and motion	Version with CG
☐	D+5	Color and sound	Master candidate
☐	D+6	Screening and revisions	Revised version
☐	D+7	Delivery	Final master, versions per medium

1-minute short-form (1 week total)

☐	Day	Stage	Deliverable
☐	Day 1	Lock the topic, outline	1-page outline
☐	Day 2	Storyboard and shoot plan	List of 6–10 cuts
☐	Day 3	Shoot	Originals, backup
☐	Day 4	Edit and captions	Rough cut
☐	Day 5	Color and sound	Master
☐	Day 6	Versions per medium, captions	Vertical version, hashtags
☐	Day 7	Post, check early response	Metrics log

Appendix Field documents

Recommended learning path and resources

A 6-month study plan for self-learners, designed around 1 hour a day.

Period	What to learn	Make each week	Check
Month 1	Visual language and shot sizes, smartphone shooting	1 video, 30 seconds	Even exposure and sound
Month 2	Editing basics, captions and rhythm	1 video, 1 minute	Smooth cut-to-cut flow
Month 3	Lighting and sound	1 interview video	Face looks three-dimensional
Month 4	Planning and storyboards	1 ad, 15 seconds	Concept fits in one sentence
Month 5	After Effects basics and compositing	1 title sequence	Composites don't look pasted on

Period	What to learn	Make each week	Check
Month 6	Color grading and running a platform	Assemble a portfolio	5 pieces collected

Types of learning resources and how to use them

Official docs

The most accurate source

- Knowing exact feature names makes searching far more efficient

Manufacturer materials

Thorough on principles

- Camera · lighting white papers and manuals, free and highly reliable

Video tutorials

Following along isn't enough

- After watching, always remake it with different material

Global ad award archives

Efficient for learning structure

- Read the winners' case summaries alongside

Theory books

One book, many times

- Film theory and editing manuals are better read repeatedly

Communities

Read processes, not just questions

- You learn more from how others solve problems

What to check after 6 months

☐	What to check
☐	5 or more finished works in your folder
☐	At least one work with its proposal and storyboard kept
☐	Have shown work to others and gotten feedback
☐	Can name the problems in your own work
☐	Have chosen an area to dig into next

> What you read is forgotten; what you make remains.
>
> Appendix Q The one thing that matters most

Appendix List of plates and production prompts

N List of plates and production prompts

22 plates beyond those placed in the text, for use in textbooks and lecture materials. The full generation prompts are kept in the manuscript files.

NOTE

All plates are monochrome vector, and the prompts are written in English so they can be entered into image-generation tools as is.

No.	Title	Section	No.	Title	Section
01	8 shot sizes compared	1.2	12	Aspect ratios overlaid	PART 3
02	6 angles compared	1.5	13	Short-form safe area guide	PART 6
03	Rule of thirds and golden ratio guide	1.6	14	Editing timeline structure	PART 5
04	8 camera-move paths, top view	1.9	15	After Effects layer stack diagram	5.5
05	Exposure triangle	3.5	16	4 easing curves compared	PART 5
06	Sensor sizes overlaid	PART 3	17	Full production pipeline map	PART 2
07	Portraits by focal length	3.4	18	Funnel and content type matching	PART 7
08	3-point lighting floor plan	4.2	19	Aspect ratios by platform	PART 6
09	6 portrait lighting patterns compared	4.3	20	XR exhibition flow floor plan	6.7
10	Chroma-key studio layout	4.6	21	Portfolio page layout	PART 10
11	Mic polar pattern diagram	4.8	22	Anamorphic illusion diagram	6.9

Appendix Exercise worksheets

K Exercise worksheets

6 forms to print and use as is. In class, photocopy and hand out; for self-study, redraw them in your notebook.

TIP

Keep a semester's worksheets together and they become both a record of your work and evi-

Worksheet 1 · One-page proposal

Appendix Exercise worksheets

Worksheet 3 · 6-panel storyboard

In each panel write SIZE · ANGLE · MOVE, and below it the action note and narration/sound effects (N / SE).

CUT 01 · TIME	CUT 02 · TIME	CUT 03 · TIME
SIZE / ANGLE / MOVE	SIZE / ANGLE / MOVE	SIZE / ANGLE / MOVE
Action note	Action note	Action note
N / SE	N / SE	N / SE

CUT 04 · TIME	CUT 05 · TIME	CUT 06 · TIME
SIZE / ANGLE / MOVE	SIZE / ANGLE / MOVE	SIZE / ANGLE / MOVE
Action note	Action note	Action note

CUT 04 · TIME	CUT 05 · TIME	CUT 06 · TIME
N / SE	N / SE	N / SE

Appendix Exercise worksheets

K

Worksheets 4 · 5 · 6

PPM checklist, reference cut analysis sheet, portfolio self-check sheet.

Worksheet 4 · PPM checklist

Item	Decided	On hold	Owner and deadline	Item	Decided	On hold	Owner and deadline
Project intent				Wardrobe and styling			
Storyboard				Shooting plan			
Directing intent				Sound plan			
Casting				Post plan			
Location				Schedule			
Art and props				Budget and risks			

Worksheet 5 · Reference cut analysis sheet

Cut	Time	Size/angle	Lighting	Why it was done this way
01				
02				
03				
04				
05				

Worksheet 6 · Portfolio self-check

What to check	Yes	What to check	Yes
Strongest work comes first		Latest work is from the last 6 months	
5–8 works in total		Links open in an incognito window	
Role and duration stated for each work		Music and font licenses checked	

What to check	Yes	What to check	Yes
Works unrelated to the target job removed		Layout holds up on mobile	
Process materials (proposal, storyboard) included		File names show your name and role	
At least one work with performance figures		Clear within 1 minute what you do	

Appendix Equipment by budget

Equipment by budget

Gear isn't bought all at once; you add it in the order bottlenecks appear. This table helps you first make what you can with what you have, then decide what the next item should be.

Why the order matters

Upgrade the camera first and sound and light remain the problem, so results barely change. Get a mic and lights first, and even the same smartphone produces visibly better work.

Stage	Added gear	What it solves	What you can make at this stage
Stage 0	Smartphone + tripod	Shake and unsteady framing	Vlogs, interviews, explainer short-form
Stage 1	External mic	Sound, the biggest reason viewers leave	Interviews, lectures, reviews
Stage 2	1 LED light + diffuser	Dark faces, low-light noise	Indoor portraits, basic product shots
Stage 3	Reflector and black foam board	Shadow control and contrast	Low-key looks, product texture
Stage 4	Mirrorless + standard zoom	Depth of field and tonality, 10-bit log	Main ad films, brand films
Stage 5	1–2 prime lenses	Low light and background separation	Mood portraits
Stage 6	Slider	Precise product moves	Product ads
Stage 7	Gimbal	Tracking shots on the move	Walk-along vlogs, space tours
Stage 8	ND filter set	Wide aperture outdoors	Outdoor portraits, cinematic looks
Stage 9	2-channel wireless mic	Shoots with several people	Conversations, documentaries

The most common gear-buying mistake

Buying the most visible things first. Sound and light, which you can't see, decide quality first.

Priorities by situation

Situation	Top three to get first	What can wait
1-person vlog	Tripod, external mic, 1 light	Gimbal, prime lens
Interviews and lectures	Lavalier, 2 lights, tidy background	Slider, drone
Product ads	Tripod, slider, diffused light	Wireless mic
Short-form series	Phone mount, light, edit automation tools	Cinema lens
Event coverage	Wireless mic, spare batteries, high-capacity cards	Gimbal

Appendix Field document templates

Field document templates

Minimal templates for the call sheet handed out on shoot day and the quote for commissioned work. If you trim items, keep the ones in bold.

Template 1 · Call sheet

Project title	**Shoot date and weather**
Call time and location	**Director / DP / producer contacts**
Cast and arrival times	**Shooting order and estimated times**
Equipment leads and load-in route	**Meals and breaks**
Parking and restrooms	**Rain backup plan**
Emergency contacts and nearest hospital	

Template 2 · Quote

Category	Item	Qty	Unit price	Amount	Notes
Planning					
Shooting					
Post					
Other					
Total					

Five things every quote must state

Scope of work (number of pieces · length · versions), number of revisions, copyright ownership, usage rights (media · term · territory) and payment terms. A quote missing any of these five breeds disputes later. Also note whether the work may go in your portfolio.

Appendix Photo plate placement guide

V Photo plate placement guide

Every diagram in this book is a monochrome vector. The twelve items below are much quicker to grasp with a real photo, so shoot them yourself or make them with generative tools and place them where indicated. The English prompts are kept in the manuscript files.

PLATE	Content	Placement	PLATE	Content	Placement
01	Real 3-point lighting studio	PART 4 · next to the 4.2 diagram	07	Projection mapping at night	PART 6 · 6.8
02	6 portrait lighting patterns compared	PART 4 · 4.3	08	Anamorphic outdoor LED	PART 6 · 6.9
03	4 focal lengths compared	PART 3 · 3.4	09	Wearing an XR device	PART 6 · 6.13
04	Real chroma key studio	PART 4 · 4.6	10	Immersive exhibition space	PART 6 · 6.7
05	Real product macro shot	PART 4 · 4.5	11	Color grading suite	PART 5 · 5.8
06	Short-form shoot	PART 6 · 6.2	12	Drone shoot	PART 3 · 3.14

Rules for photo plates

01 Generated images that look like real people can invite portrait-rights misunderstandings, so make faces unidentifiable.

02 Never prompt for a recreation of frames from a specific film or ad.

03 For print, work out the resolution needed at 300dpi, then upscale.

04 Lower the saturation so photos match the tone of the diagrams; it helps the book feel unified.

Appendix Reviewer comments and revisions

Reviewer comments and revisions

Once the first draft was done, it was reviewed in five fields. Each point raised was either worked into the text or, if not, the reason was recorded.

Field	Comment	Revision
01 DP · gaffer — feasibility on set		
Camera · lighting	State early on that frame rate and light level are linked. People keep trying 120fps without a lighting plan and failing.	Raised the light-scaling warning to body text in the PART 3 frame-rate section and added it to the part summary
Camera · lighting	Teach 3-point lighting first and students conclude they can't shoot without three lights.	Made the 4.3 key-light summary its own section and put the key-light-alone principle first
Camera · lighting	Chroma key failures keep happening. A table of causes and fixes by symptom is needed.	Added a four-column table (symptom · cause · on-set fix · post fix) to 4.6, plus a layout plate
Camera · lighting	Distinguish lux, lumens and nits. Without light units you can't read quotes or spec sheets.	Added 3.6 on units of illuminance and light output, with a table of target illuminance by situation
02 Editing · motion graphics director — tools and workflow		
Editing · motion	Cover why composites look wrong before listing features.	In 5.7, split three causes (black level, atmospheric perspective, grain) into separate items
Editing · motion	Many students confuse Premiere with After Effects and try to cut in After Effects.	Stated in the 5.5 intro that horizontal is time and vertical is layers; added a layer-stack plate
Editing · motion	The 12 principles of animation can't be conveyed in words. They need pictures.	Drew all 12 principles in one diagram and placed it in 5.6
Editing · motion	Shortcuts only get used if gathered in an appendix.	Listed Premiere and After Effects shortcuts separately in Appendix G
03 Ad planner — working documents and how they persuade		
Ad planning	Students write the PPM as a formality. Show the cost of changes at each stage in numbers and they are convinced.	Added a change-cost multiplier table and a curve plate to 2.2
Ad planning	Given only a proposal template, students can't fill it in. They need a filled-in example.	Included a full sample proposal for a university promo short-form video in 2.8
Ad planning	Explain hooks as a matter of instinct and no one can repeat them. They need a typology.	Added a table of six hook types and don'ts to 7.2
Ad planning	If no one teaches how to study references, it ends in imitation.	Added a six-step research process to 7.6, from defining the goal to differentiating, and an analysis worksheet to the appendix
04 Immersive content · exhibition planner — space and operations		
Exhibition planning	Without LED spec terms you can't talk to vendors. Pixel pitch and luminance are a must.	Added 7.10, a table of six key terms with criteria for judging each
Exhibition planning	Motion sickness in 360 content gets mistaken for a technical problem. Make clear it is a directing problem.	Described the no-acceleration and fixed-reference principles in 6.5 from a directing angle; added a stitching plate

Field	Comment	Revision
Exhibition planning	Leave dwell-time calculations out of an exhibition proposal and you get queues on site.	Put the visitors-per-hour formula into the body of 6.7; added a circulation floor-plan plate
Exhibition planning	Sorting AR · MR · VR by device leads to endless confusion.	Made a diagram of the real-to-virtual continuum to show where the concepts divide
05 Instructional design · career services — learner level and usability		
Instructional design	200 pages is hard to cover in one semester. Specify what to use in each session.	Added a guide for instructors to the front matter and a 15-week plan to Appendix H
Instructional design	Lists alone don't convey context. Prose explanation is needed.	Opened each part with a three-paragraph essay and closed it with a key-point summary
Career services	Students only prepare for jobs if it's treated as a course of its own.	Made PART 10 a standalone part covering portfolio, résumé, interviews, communication and cases
Instructional design	More colors mean higher printing costs, and information disappears in photocopies.	Redesigned the whole book in one color, building hierarchy from value contrast and type size alone

Comments not adopted

The suggestion to include screen captures of example videos was not adopted. Besides the copyright issue, the moment a textbook prints frames from a particular work, it becomes a textbook for copying that work. Instead, techniques are abstracted into diagrams that apply to any subject.

Appendix Reference photo list and generation prompts

Reference photo list and generation prompts

The 135 images that fill the reference photo slots in the text. All are staged references made with generative image models, not photographs of real people or specific works. The full generation prompts are kept in the production files.

IDs stand for "section · group · slot." For example, 1.2A-a is the first shot of the first gallery in section 1.2.

Model labels

GPT denotes the GPT Image family and NB the Nano Banana family (generated on Higgsfield). Shots that needed a consistent character were made with NB.

TIP

In class, regenerate them with the same prompts, or set a task in which students shoot under the same conditions and compare.

ID	Caption	Section
PART 12		
12.12A-a	Camera obscura — the outside scene upside down on a wall	12.12
12.12A-b	Daguerreotype camera — wooden box and brass lens	12.12
12.12A-c	Large-format view camera — pleated bellows and dark cloth	12.12
12.12B-a	Box roll-film camera — anyone can take pictures	12.12
12.12B-b	35mm rangefinder — street photography	12.12
12.12B-c	Film SLR and a roll of film	12.12
12.12C-a	Instant camera — a picture that appears in minutes	12.12
12.12C-b	Early digital compact camera and memory card	12.12
12.12C-c	Smartphone multi-lens camera	12.12
12.13A-a	Darkroom under a red safelight	12.13
12.13A-b	Enlarger — projecting a negative onto photo paper	12.13
12.13A-c	An image emerging in the developer	12.13
12.13B-a	Negatives and a loupe on a lightbox	12.13
12.13B-b	Contact sheet — picks marked	12.13
12.13B-c	Prints drying after the wash	12.13
12.13C-a	4-color offset press — C · M · Y · K, four plates	12.13
12.13C-b	Halftone dots magnified — CMYK rosette	12.13
12.13C-c	Proof and loupe — checking print color	12.13
12.14A-a	Magic lantern — projecting glass slides	12.14
12.14A-b	Zoetrope — motion seen through slits	12.14
12.14A-c	Phenakistiscope — a spinning disc in a mirror	12.14
12.14B-a	Kinetoscope — a box viewed one person at a time	12.14
12.14B-b	35mm film projector in a projection booth	12.14
12.14B-c	Slide projector — 35mm slides in a carousel tray	12.14
12.14C-a	8mm home-movie projector	12.14
12.14C-b	OHP — a classroom projecting transparencies	12.14
12.14C-c	A family in front of a CRT TV	12.14
1.14D-a	Videotape and VCR	12.14
1.14D-b	Flat-panel TV and streaming	12.14
1.14D-c	Handheld screens and VR — the personal screen	12.14
PART 01		
1.2A-a	Extreme long shot — the space is the star, the person a dot	1.2
1.2A-b	Long shot — full figure and surroundings	1.2
1.2A-c	Full shot — head to toe	1.2

ID	Caption	Section
1.2B-a	Knee shot — from the knees up	1.2
1.2B-b	Medium shot — from the waist up	1.2
1.2B-c	Bust shot — from the chest up	1.2
1.2C-a	Close-up — the whole face	1.2
1.2C-b	Extreme close-up — the eyes	1.2
1.2C-c	Insert — hands and objects	1.2
1.3A-a	One-shot — one person's judgment and emotion	1.3
1.3A-b	Two-shot — distance between two people = distance in their relationship	1.3
1.3A-c	Group shot — team and community	1.3
1.4A-a	Over-the-shoulder — a conversation past a shoulder	1.4
1.4A-b	POV shot — what the character sees	1.4
1.4A-c	Reaction shot — the listener's face	1.4
1.4B-a	Establishing shot — setting up place and time	1.4
1.4B-b	Insert — the decisive detail	1.4
1.4B-c	Cutaway — compressing time, setting mood	1.4
1.5A-a	Eye level — neutral and equal	1.5
1.5A-b	High angle — small and vulnerable	1.5
1.5A-c	Low angle — authority and menace	1.5
1.5B-a	Bird's-eye — looking straight down	1.5
1.5B-b	Dutch angle — tilted unease	1.5
1.5B-c	Worm's-eye — looking up from the ground	1.5
1.17A-a	Face, low angle — chin and nostrils, authority	1.17
1.17A-b	Face, eye level — conversation and empathy	1.17
1.17A-c	Face, high angle — bigger forehead, smaller chin	1.17
1.6A-a	Rule of thirds — eyes on an intersection	1.6
1.6A-b	Golden ratio — toward the center of the spiral	1.6
1.6A-c	Central symmetry — a declarative frontal view	1.6
1.6B-a	Rhythm and repetition — only one is different	1.6
1.6B-b	Leading lines — to the vanishing point	1.6
1.6B-c	Frame within a frame — a trapped gaze	1.6
1.18A-a	Facing gazes — the axis of a relationship	1.18
1.18A-b	Following a gaze to an object — eyeline match	1.18
1.18A-c	Brightness and sharpness lead the eye	1.18
1.9A-a	Dolly — moving forward on track	1.9
1.9A-b	Arc — circling the subject	1.9
1.9A-c	Crane — vertical rise and scale	1.9
1.9B-a	Pan — sweeping a space from a fixed axis	1.9
1.9B-b	Zoom in — same viewpoint, only the image grows	1.9

ID	Caption	Section
1.9B-c	Zoom out — the context emerges	1.9
1.14A-a	Orange and teal — separating the subject	1.14
1.14A-b	Cold blue — isolation	1.14
1.14A-c	Single accent color — forcing the eye	1.14
PART 03		
3.4A-a	24mm — expanded space and distortion	3.4
3.4A-b	50mm — natural perspective	3.4
3.4A-c	135mm — compressed background, isolation	3.4
3.5A-a	F1.4 — shallow depth of field	3.5
3.5A-b	F8 — deep depth of field	3.5
3.5A-c	High ISO — noise	3.5
3.8A-a	360-degree shutter — long smears	3.8
3.8A-b	45-degree shutter — choppy sharpness	3.8
3.8A-c	High-speed shooting — a frozen droplet	3.8
3.9A-a	WB set to 3200K in daylight — bluish	3.9
3.9A-b	WB set to 5600K in daylight — normal	3.9
3.9A-c	WB set to 7500K in daylight — yellowish	3.9
3.9B-a	Mixed light — window daylight and indoor tungsten	3.9
3.9B-b	Setting the reference with a gray card	3.9
3.9B-c	Deliberate color shift — the blue of dawn	3.9
3.11A-a	Tripod and fluid head	3.11
3.11A-b	Slider	3.11
3.11A-c	3-axis gimbal	3.11
PART 04		
4.2A-a	Key light only	4.2
4.2A-b	Key+fill	4.2
4.2A-c	Key + fill + backlight	4.2
4.4A-a	High key — bright, forgiving light	4.4
4.4A-b	Low-key portrait — darkness dominates	4.4
4.4A-c	Low-key product — luxury and focus	4.4
4.5A-a	Glass — backlight for transparency	4.5
4.5A-b	Metal — strip-light reflections	4.5
4.5A-c	Food — backlight for steam and sheen	4.5
4.6A-a	An evenly lit green screen	4.6
4.6A-b	Spill — green on the edges	4.6
4.6A-c	Finished composite	4.6
4.8A-a	Boom shotgun — aimed from above	4.8
4.8A-b	Lavalier — hidden in the collar	4.8

ID	Caption	Section
4.8A-c	Recording an interview on location	4.8
PART 05		
5.13A-a	Cel animation — painting on clear cels	5.13
5.13A-b	Cutout animation — moving cut-out pieces	5.13
5.13A-c	Sand animation — scenes drawn in sand	5.13
5.13B-a	Pixilation — shooting people frame by frame	5.13
5.13B-b	Paper · clay stop motion	5.13
5.13B-c	3D CG — a character in virtual space	5.13
5.13C-a	2D — drawing in line and shape	5.13
5.13C-b	3D — volume and lighting	5.13
5.13C-c	2.5D — 3D with a 2D texture	5.13
PART 02		
2.1A-a	Hand-drawn storyboard	2.1
2.1A-b	Animatic in the editor	2.1
2.1A-c	Location scouting	2.1
PART 06		
6.5A-a	360 camera rig	6.5
6.5A-b	Raw equirectangular frame	6.5
6.5A-c	Watching in a VR headset	6.5
6.9A-a	Anamorphic corner LED	6.9
6.9A-b	LED wall virtual production	6.9
6.9A-c	Transparent LED shop window	6.9
6.13A-a	Media facade	6.13
6.13A-b	Immersive exhibition space	6.13
6.13A-c	Wearing AR glasses	6.13
6.14A-a	Point — a single light in the dark	6.14
6.14A-b	Line — a trail drawn with light	6.14
6.14A-c	Plane — a screen catching light	6.14
6.14B-a	Volume — form built from light	6.14
6.14B-b	Time — the path of movement	6.14
6.14B-c	Moving through space — a scene that changes as you walk	6.14

S Explanatory plates and figure · equipment drawings

Besides the reference photos, this lists the explanatory plates G-01–G-24 that head each section and the monochrome drawing sources for the figure · equipment slots in the diagrams. The full prompts are kept in the production files.

Explanatory plates G-01–G-24

ID	Caption	Section	ID	Caption	Section
G-01	8 shot sizes — same person, same place, only the distance changes	1.2	G-13	Chroma key set — background and subject lighting kept separate	4.6
G-02	The psychology of angles — high · eye level · low angle	1.5	G-14	Types of mic — shotgun · lav · handheld · recorder	4.8
G-03	Principles of composition — thirds · symmetry · leading lines	1.6	G-15	Before and after compositing — chroma key source and final frame	5.7
G-04	The 180-degree rule — the line between two people and camera placement	1.8	G-16	Color grading — the log original and two looks	5.8
G-05	Camera movement gear and paths — dolly · crane · gimbal · arc	1.9	G-17	Squash and stretch — a bouncing ball in sequence	5.6
G-06	How focal length changes face and background — 16 · 35 · 85 · 200mm	3.4	G-18	Storyboarding — shot · movement · time written in every panel	2.1
G-07	The exposure triangle — the traces left by aperture · shutter · ISO	3.5	G-19	360 video and VR — a space where the viewer becomes the camera	6.5
G-08	White balance — one scene, four color temperature settings	3.9	G-20	Projection mapping — a building's surface becomes the screen	6.8
G-09	Shutter speed and motion — 180-degree shutter and fast shutter	3.8	G-21	Anamorphic LED — the 3D illusion of a corner screen	6.9
G-10	Camera support — tripod · slider · gimbal · shoulder rig · drone	3.11	G-22	Screens of different lengths — from bumper ads to feature films	7.16
G-11	3-point lighting on set — key · fill · backlight and camera	4.2	G-23	Adjective-keyword mood board — 'cold, still and lonely'	2.12
G-12	High key and low key — same person, different worlds of light and shadow	4.4	G-24	Mise-en-scène and blocking — actors · lighting · art · camera in one frame	2.13

Figure · equipment drawing sources for the plates

All are monochrome pencil · wash drawings generated with GPT. So that the same people recur across diagrams, they were derived from base characters (H0, W1, C1).

Set	ID	Used in
Head drawings (17)	H0 · HFLAT · HLOOP · HREMB · HSPLIT · HBUTT · HRIM · L3KEY · L3FILL · L3BACK · HHIGH · HLOW · GRIGHT · GLEFT · GDOWN · GSMILE · INTV	Figure slots in the diagrams for 6 face-lighting patterns, 3-point lighting steps, face angles, gaze direction and interviews (base character H0)
Full-body drawings (39)	F1–F6 · BR · SL1–SL4 · SR1 · SR2 · WR · WL · W1–W8 · A01 · A05–A10 · AD · AT · LA1–LA3 · C1–C3 · SB	Figure slots in the diagrams for shot size, body proportion, composition, blocking, chroma key, the 8-pose walk cycle, the 12 principles of animation, line of action, cut transitions and storyboards (base characters W1 · C1)
Device diagrams · cameras (10)	OBSCURA · DAGUERRE · WETPLATE · KODAK · LEICA · POLAROID · SLR · DIGPROTO · COMPACT · PHONE	Figure 114 Timeline of the changing camera
Device diagrams · viewing devices (15)	LANTERN · ZOETROPE · KINETO · CINEMATO · CRT · SLIDEPROJ · OHP · VHS · DVD · FLATTV · LAPTOP · SMARTPHON · OTT · VR · SHORTS	Figure 118 Timeline of devices for watching moving images
Device diagrams · optical toys (4)	THAUMA · PHENAK · ZOETROPE2 · FLIPBOOK	Figure 117 Optical toys for viewing moving pictures

PART 14 Wrap-up

Exercises and review

01 **Print and use the 6 worksheets**

Fill in the Appendix K templates as they are for a project in progress.

02 **Run through the checklists twice**

Once the day before the shoot and once just before delivery; note any item that gets flagged.

One-page summary

01 Trust paper	Don't trust memory; trust paper. Only what is written gets done.
02 Two checks	Run through the checklist once the day before the shoot and once just before delivery.
03 Worksheets that become a record	They are made to be printed and used. Fill them in for a semester and they become a record of your work.
04 What a checklist is for	It does not aid memory; it replaces memory. Don't try to memorize it; keep it open in front of you.

Questions to consider

Q What do I keep missing?

Can I turn it into a procedure? The moment a missed item becomes a line on a checklist, the mistake moves from a personal problem to a system problem.

Appendix List of figures

Figures

List of figures

A list of the 91 diagrams in the text.

No.	Title	No.	Title
1	The phi phenomenon — the brain fills the gap between two still stimuli with motion	47	The layer stack in After Effects
2	Key turning points in moving-image technology	48	The 12 principles of animation — motion shown through a character
3	How a camera works — pinhole, lens, recording surface	49	Arc · timing · spacing · squash in a bouncing ball
4	The changing camera — 200 years of shrinking exposure times, size and printing steps	50	Timing vs. spacing
5	Darkroom work — from negative to positive	51	6 steps of keying in practice
6	Color of light, color of ink — RGB, CMYK, halftone dots	52	Tonal change at each color grading stage
7	Optical toys for viewing moving pictures	53	5 easing curves
8	How we watched moving images — from a shared dark room to a screen in your hand	54	Eight kinds of animation
9	Frames by aspect ratio — same two people, changing space around them	55	2D and 3D — drawings that create motion vs. motion that is designed
10	8 shots by camera-to-subject distance	56	Map of the whole video production pipeline
11	Shot-size cut lines on body proportions	57	Elements of a storyboard panel
12	Shot types by number of people	58	Example storyboard for a 15-second ad in 6 cuts
13	5 angles by camera height	59	Cost of changes by production stage
14	Side view of 5 camera heights	60	Standard interview setup and the resulting frame
15	Camera positions around the subject	61	Four-part and 3-act structure — planting and paying off along the tension curve
16	Six principles of composition — thirds · golden ratio · symmetry · rhythm · leading lines · frame within a frame	62	Mise-en-scène and blocking — placement in the frame and movement seen from above
17	Headroom, nose room, lead room — three names for empty space	63	Adjective-keyword design thinking — 3 adjectives, sensory axes, translation into production language
18	The 180-degree rule — keep the camera on one side of the line	64	Safe areas on a short-form screen
19	The 30-degree rule — move the camera at least 30 degrees	65	Stitching in 360 shooting and ways to guide the gaze
20	Paths of 8 camera moves	66	AR, MR and VR on the continuum from real to virtual

No.	Title	No.	Title
21	Zoom vs. dolly — same size, different space	67	XR exhibition hall circulation plan
22	Three ways to join cuts	68	How the anamorphic illusion works
23	Cut length distribution by emotion	69	Screen size and attention by viewing environment
24	Value structure of four color strategies	70	Map of screen specs by medium
25	Angles on the face — how camera height changes facial proportions	71	Projection mapping and LED signage compared
26	Two uses of the gaze — eyeline match when facing, gaze link when following	72	Projector throw distance and image size
27	Story time and screen time — six shifts in time and space	73	4 XR devices compared
28	Sensor sizes compared	74	Binocular recording in spatial video
29	Angle of view by focal length	75	Dimensions of form — motion adds one dimension at a time
30	The exposure triangle — how aperture, shutter speed and ISO offset each other	76	Standard structure of a 15-second ad
31	Depth of field by aperture — same scene, different background	77	Six devices for the 3-second hook
32	Resolution standards compared	78	Matching video formats to the marketing funnel
33	Common aspect ratios compared	79	Line of action — one curve through the pose
34	Frame rates compared — how many pictures to cut 1 second into	80	8 poses of one walk cycle
35	Shutter angle and exposure time (at 24fps)	81	Video formats by length — shorter means one message, longer means deeper characters
36	Color temperature scale by light source	82	Re-hooking a 1-minute ad — grab viewers again just before they drop off
37	White balance settings and light sources — white paper is the reference	83	15-second outdoor LED loop — silent, seen from afar, seamless repeat
38	The inverse square law — double the distance, 1/4 the brightness	84	AI production pipeline
39	3-point lighting — floor plan and the effect of each step	85	Map of generative tools
40	6 portrait lighting patterns by key-light position	86	The order for reading performance metrics
41	How lighting ratio changes contrast	87	Career paths by role
42	Chroma key studio layout and 3 compositing steps	88	Map of video jobs
43	Safe range for recording levels	89	Standard portfolio page layout
44	4 mic polar patterns	90	Job-prep matrix by role
45	Sound timeline of a 15-second ad in 4 layers	91	6-month portfolio roadmap
46	Anatomy of an edit timeline		

Afterword

15 seconds is not short

Good video doesn't come from gear. It is made by someone who has decided what to show.

Every plate, table and checklist in this book is a tool for shortening the moment of decision. The faster you decide, the more you try, and you get better as much as you try.

What you read fades; what you make remains. Shoot at least one cut today.

Whoever makes the first 3 seconds earns the right to the other 12.

> Whoever makes the first 3 seconds earns the right to the other 12.

> Jia Ahn

Appendix Templates

X

8 storyboard templates

9-panel (or 8 · 6-panel) templates for each ratio. Copy them at A4, or enlarge to A3 and pin them to the wall. The five lines outside the panels are the same on every template — measurements, movement, action note, words, sound.

How to use

Panel one is the legend

- Ratio · resolution · version · date go in panel one
- Arrows: black for people, wine for camera
- Time: duration in seconds + running timecode

Vertical templates

Avoid UI overlays

- No captions · logos inside the gray bands
- Faces in the top 1/3, products in the center
- 20–30% more cuts than horizontal

360 · curved

Unwrapped view + viewpoint map

- Write the front angle in every panel
- Keep total rotation under 180° per scene
- Leave seams · floor · ceiling empty

Storyboard template · 16:9

Horizontal default — YouTube·TV·presentations · 1920×1080 · 3840×2160

Dotted lines = module seams (no text). Text · faces only in the eyeline band (1.4–1.8m above the floor).

Appendix Generated images

Generated reference photos and their prompts

ID, placement and generation prompt for the 183 reference photos made for this edition. All were generated without real people, brands or logos; the same prompt gives a similar, not identical, image.

ID	Used	Prompt
P00-FRAME	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. close-up of a camera field monitor showing a street scene with white frame-guide lines and safe-area rectangles overlaid, shallow focus on the screen, film set in background
P00-RATIOS	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. same living-room scene shown on three devices arranged side by side on a table: a 16:9 television, an ultra-wide cinema monitor with letterbox bars, and a vertical smartphone, demonstrating aspect ratios
P00-FPS	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. a horizontal strip of twelve sequential high-speed frames of a water droplet splashing into a cup, arranged like a film strip on a lightbox
P00-TIMELINE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. close-up of a video editing timeline on a monitor, clips grouped in colored blocks, a hand on a shuttle wheel, dark room
P00-PHONEVERT	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. young woman filming a street food stall vertically with a smartphone at night, warm stall light, bokeh
P01-PERSIST	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. a Victorian zoetrope spinning on a wooden table, a child peering through the slits, warm lamp light
P01-PREFILM	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. 19th-century parlor magic lantern show, a brass lantern projecting a glass slide image onto a linen sheet, family watching in candlelight
P01-SILENT	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. 1900s film crew with a hand-cranked wooden movie camera on a tripod on a city street, period clothing, black-and-white tonality
P01-TALKIE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. 1930s sound stage: blimped camera, microphone boom over actors, crew with headphones, monochrome tone
P01-TV	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. 1960s television studio floor with pedestal cameras and a lit news desk, control room window above, monochrome monitors
P01-VHS	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. 1990s analog video editing suite with tape decks, CRT monitors, jog wheels and cables, an editor at the console
P01-WEB	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. 2010s bedroom vlogger talking to a camera on a small tripod with a ring light and laptop, fairy lights
P01-GENAI	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. contemporary creator reviewing AI-generated video clips on a large monitor, a prompt panel and a grid of variations, studio desk
P01-KOREA	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. 1990s Korean film set in a narrow Seoul alley at night, 35mm camera on dolly track, crew with walkie-talkies, neon signs blurred
P01-PRINCIPLES	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. film school seminar: students around a table with a projected film still on the wall, notebooks, a professor pointing at the frame

ID	Used	Prompt
P01-THEORY	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. stack of worn film-theory books, a lightbox with 35mm film strips and a loupe, pencil notes, desk lamp
P02-OTS	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. over-the-shoulder two-shot in a cafe: the back of a man's shoulder and head in soft focus on the left foreground, a woman facing him in focus, 50mm look
P02-POV	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. point-of-view shot from a seated person: their own hands holding a coffee cup in the lower frame, across the table a smiling friend looking into the lens
P02-REACTION	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. reaction close-up of a young man listening, subtle surprised smile, eyes slightly off-lens, window light
P02-GAZE-MUTUAL	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. two people in profile facing each other at close distance, eye to eye, window backlight, symmetrical framing
P02-GAZE-CAMERA	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. a woman looking directly into the camera lens, neutral calm expression, medium close-up, grey wall
P02-GAZE-AWAY	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. a man looking off-frame to the left into the distance, generous look room on the left, soft daylight
P02-GAZE-BACK	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. a person seen from behind standing at a window looking out over a city skyline at dusk
P02-GAZE-SHARED	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. two colleagues looking at the same laptop screen together, heads angled toward the screen, office light
P02-ESTAB	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. establishing wide shot of a Seoul residential neighborhood at blue hour, low-rise buildings, warm windows, mountains behind
P03-A7DIAL	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. macro close-up of a mirrorless camera's top plate: mode dial with P S A M markings, exposure compensation dial and shutter button, shallow focus
P03-LENSTRIO	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. three prime lenses standing in a row on a wooden table: a compact 55mm, a medium 85mm, and a long 200mm telephoto, soft window light
P03-360CAM	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. young man holding a compact 360-degree camera on a thin invisible selfie stick in a city park, the camera at arm's length above him
P03-WEARCAM	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. thumb-sized wearable action camera clipped to the brim of a cap and a magnetic pendant version on a chest, close-up, outdoor
P03-DRONE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. small folding camera drone taking off from an open palm at dawn in a riverside park, operator with controller
P03-TRIPOD	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. camera operator adjusting the pan drag on a fluid-head video tripod, cinema camera mounted, studio
P03-GIMBAL	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. operator walking with a three-axis handheld gimbal and mirrorless camera following a subject on a bridge, motion
P03-ND	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. hand holding a variable ND filter in front of a lens against bright sunlight, visible darkening through the glass
P03-PHONERIG	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. smartphone mounted in a metal cage rig with a small shotgun microphone and mini LED light, on a tabletop tripod
P03-MONITOR	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. external camera monitor showing false-color exposure view of a face, waveform scope in corner, rig in foreground

ID	Used	Prompt
P03-SENSOR	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. macro shot of a full-frame mirrorless camera sensor with the lens removed, reflections on the sensor glass, dark background
P04-FRESNEL	✔	Clean studio product photograph of unbranded film-lighting equipment on a dark grey seamless floor, soft top light, slight side angle, the lamp switched on with a visible beam, no text, no logos. a tungsten Fresnel spotlight with barn doors
P04-OPENFACE	✔	Clean studio product photograph of unbranded film-lighting equipment on a dark grey seamless floor, soft top light, slight side angle, the lamp switched on with a visible beam, no text, no logos. an open-face redhead tungsten light with reflector
P04-HMI	✔	Clean studio product photograph of unbranded film-lighting equipment on a dark grey seamless floor, soft top light, slight side angle, the lamp switched on with a visible beam, no text, no logos. an HMI daylight PAR light with ballast on the floor
P04-LEDPANEL	✔	Clean studio product photograph of unbranded film-lighting equipment on a dark grey seamless floor, soft top light, slight side angle, the lamp switched on with a visible beam, no text, no logos. a bi-color LED panel light on a stand
P04-COBSOFT	✔	Clean studio product photograph of unbranded film-lighting equipment on a dark grey seamless floor, soft top light, slight side angle, the lamp switched on with a visible beam, no text, no logos. a COB LED light with a large octagonal softbox
P04-TUBE	✔	Clean studio product photograph of unbranded film-lighting equipment on a dark grey seamless floor, soft top light, slight side angle, the lamp switched on with a visible beam, no text, no logos. two RGB LED tube lights, one white one blue, on clamps
P04-KINO	✔	Clean studio product photograph of unbranded film-lighting equipment on a dark grey seamless floor, soft top light, slight side angle, the lamp switched on with a visible beam, no text, no logos. a four-bank fluorescent softlight fixture
P04-RING	✔	Clean studio product photograph of unbranded film-lighting equipment on a dark grey seamless floor, soft top light, slight side angle, the lamp switched on with a visible beam, no text, no logos. a ring light with a camera mounted in the center
P04-CHINABALL	✔	Clean studio product photograph of unbranded film-lighting equipment on a dark grey seamless floor, soft top light, slight side angle, the lamp switched on with a visible beam, no text, no logos. a paper lantern china ball light hanging from a boom
P04-DEDO	✔	Clean studio product photograph of unbranded film-lighting equipment on a dark grey seamless floor, soft top light, slight side angle, the lamp switched on with a visible beam, no text, no logos. a small focusing pin-spot light with a projection attachment casting a tight circle
P04-PRACTICAL	✔	Clean studio product photograph of unbranded film-lighting equipment on a dark grey seamless floor, soft top light, slight side angle, the lamp switched on with a visible beam, no text, no logos. a vintage table lamp used as a practical light on a set table
P04-REFLECTOR	✔	Clean studio product photograph of unbranded film-lighting equipment on a dark grey seamless floor, soft top light, slight side angle, the lamp switched on with a visible beam, no text, no logos. a collapsible 5-in-1 reflector held by a grip, white side, bouncing light
P04-BOUNCE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. outdoor shoot: a grip holding a large white bounce board to fill an actress's face in afternoon sun
P04-NEGFILL	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. studio portrait setup with a black flag on a C-stand beside the subject to deepen the shadow side
P04-3POINT	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. wide shot of an interview lighting setup: key softbox, fill bounce, back light on a boom, subject on a stool, camera and monitor
P04-PRODUCT-GLASS	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. cosmetic glass bottle standing on a clear acrylic sheet with water droplets, backlit, two long strip highlights on the edges, dark background
P04-PRODUCT-MIST	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. fine mist sprayed over a chilled beverage bottle, frozen by flash, dark background with a single rim light
P04-PRODUCT-TURN	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. skincare product on a motorized turntable with five identical units arranged behind, top softbox, white seamless
P04-PRODUCT-SPLASH	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. high-speed photograph of a water splash crown around a glass bottle, frozen droplets, backlight through the liquid
P04-PRODUCT-LIGHTPASS	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. a hand passing a small LED tube light across a perfume bottle, long exposure light streak, dark

ID	Used	Prompt
P04-CHROMA	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. wide shot of a green-screen studio: four lights evenly washing the green backdrop, separate key and back light on a presenter standing on a marked spot, camera in foreground
P04-CHROMA-CLOSE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. close-up of a green screen with even illumination and a light meter held against it, reading the backdrop
P04-MIC-WIRELESS	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. compact wireless lavalier transmitter clipped to a shirt collar, with the small receiver mounted on a mirrorless camera, close-up
P04-MIC-SHOTGUN	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. boom operator holding a shotgun microphone in a furry windshield above two actors, outdoor
P04-ASMR	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. ASMR recording setup: dual binaural microphones with a dummy head, hands tapping a wooden box and brushing a mic, soft pink light
P04-FOLEY	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. foley artist stepping on a tray of gravel in front of a microphone while watching a screen
P04-AMBIENT	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. handheld field recorder with furry windscreen placed near a crackling fireplace, warm glow
P04-SLEEP	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. smartphone on a nightstand playing a rain-on-window ambience video, dim bedroom, person asleep in background
P05-SPLICER	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. editor's hands at a vintage 35mm film splicer, cut film strips, tape, a pair of white cotton gloves, warm lamp
P05-FLATBED	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. a flatbed film editing table with reels, small viewing screen and film threaded through, dim editing room
P05-NLE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. editor at a dual-monitor nonlinear editing suite, timeline with color-coded clips, a reference monitor showing a city shot
P05-COLOR	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. color grading suite: colorist at a control surface with trackballs, scopes on one screen, graded image on a calibrated monitor
P05-ROTO	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. split-screen style still: left half a person in front of a green screen with a dashed mask outline, right half the same person composited into a street scene
P05-MOGRAPH	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. motion designer at a workstation with a 3D viewport showing a camera rig and null objects, animated text layers
P05-ANIMCEL	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. animator at a light table flipping stacked drawing sheets, pencil keyframes of a bouncing ball
P05-STOPMO	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. stop-motion set: a small puppet on a miniature kitchen set, DSLR on a rig, animator adjusting the arm with tweezers
P05-3D	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. 3D animation workstation showing a wireframe character rig in the viewport, graph editor curves below
P05-DELIVER	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. two labeled portable SSDs, a checklist on paper and a laptop showing an export progress bar, tidy desk
P06-BRAINSTORM	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. creative team at a whiteboard covered with colorful sticky notes and quick sketches, one person placing a note
P06-BRIEF	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. a client brief document with highlighter marks and a pen, coffee cup, notebook with a one-sentence concept circled
P06-SCRIPT	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. screenplay pages on a desk with handwritten margin notes, index cards in a row, reading glasses

ID	Used	Prompt
P06-PROPOSAL	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. planner presenting a one-page video proposal on a laptop to a client, printed storyboard beside
P06-SB-HAND	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. overhead view of a hand-drawn pencil storyboard sheet with six 16:9 panels, camera-move arrows, timing notes under each panel, pencils and eraser beside
P06-SB-VERT	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. overhead view of a storyboard sheet designed for vertical video: a row of tall 9:16 panels with sketches and notes, phone lying beside for scale
P06-SB-DIGITAL	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. storyboard artist drawing panels on a pen tablet, the screen showing a grid of frames with arrows
P06-ANIMATIC	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. editor assembling an animatic: storyboard frames on a timeline with an audio waveform, scratch narration recording mic on desk
P06-SB-360	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. a designer's sketchbook showing a wide 2:1 panoramic storyboard panel with grid lines and notes for a 360 video, pencil and compass
P06-SB-FACADE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. architectural elevation drawing of a building with a pixel grid overlay and colored light pattern sketches, tracing paper, scale ruler
P06-PPM	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. pre-production meeting: team around a table with printed storyboards, mood boards and a schedule pinned on the wall, laptop with reference video
P06-MOOD	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. physical mood board: pinned photos, fabric swatches, color chips in warm grey, dusty blue and wine red, handwritten adjective labels (illegible)
P06-SCOUT	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. location scout photographing a sunlit cafe interior with a phone while holding a printed storyboard, light meter on the table
P06-CASTING	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. casting session: an actress on a mark in front of a grey backdrop, a camera on a tripod, three people at a table watching
P06-WARDROBE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. stylist reviewing a wardrobe rack with tagged outfits in warm greys and dusty blue, swatch book in hand
P06-PROPS	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. props table with items laid out on a numbered sheet: ceramic cup, book, eucalyptus, product bottles, labeled tags
P06-CALLSHEET	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. a call sheet on a clipboard with a coffee cup at dawn on a production van's hood, walkie-talkie
P06-SLATE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. clapperboard held in front of an actress at a cafe window, camera assistant's hands
P06-SCHEDULE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. production scheduling board with colored strips and a wall calendar marked with shoot days and weather icons
P06-TEAM	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. small film crew huddle on set: director, cinematographer and producer looking at a monitor together
P06-INTERVIEW	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. two-camera interview setup in an office: subject on a chair, key softbox, interviewer off-axis
P07-VERT-SHOOT	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. creator filming vertical video with a smartphone on a gimbal in a bright shopping street
P07-SCOPE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. empty cinema with an ultra-wide 2.39:1 screen showing a desert horizon, seats in foreground
P07-VR-USER	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. person wearing a VR headset in a living room reaching out with both hands, dramatic cool light, slight motion blur on hands

ID	Used	Prompt
P07-VR-WORLD	✔	Stylized 3D rendered first-person view inside a virtual museum hall: floating framed artworks, glowing floor path markers, a hand controller visible, depth and perspective lines, no text
P07-360RIG	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. 360-degree camera on a tall thin monopod standing alone in a plaza at golden hour, no operator visible nearby
P07-AR-PHONE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. smartphone screen showing an augmented-reality sofa placed in a real living room, hand holding the phone, the real room visible around
P07-AR-GLASS	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. young woman wearing slim smart glasses in a cafe, faint translucent caption-like light shapes reflected in the lens (no legible text), shallow focus
P07-MR-MUSEUM	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. museum visitor wearing a mixed-reality headset looking at an ancient stone artifact, a translucent holographic reconstruction of the complete object glowing above it
P07-HUD	✔	Cinematic first-person view through a futuristic visor: a street scene with a translucent targeting reticle, scanning brackets and data-like glyph bars overlaid (illegible), amber monochrome tint, retro sci-fi film still look
P07-PROJECTION	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. projection mapping on a historic stone building facade at night, geometric light patterns following the windows and columns, crowd silhouettes
P07-ANAMORPHIC	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. corner-wrapped LED billboard at a city crossing at night showing a 3D anamorphic illusion of a giant wave spilling out of the screen, pedestrians looking up
P07-LEDWALL	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. virtual production stage: a curved LED volume showing a night highway, a real car on set, camera on a crane, crew
P07-FACADE-PALACE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. a traditional East Asian palace gate with tiled roof lit by a colorful media facade projection at night, audience on the plaza
P07-FACADE-DOME	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. a large domed civic building at night with its facade used as a media facade, pixel-like light grid, river in foreground
P07-TRANSLED	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. transparent LED film on a glass storefront showing floating product graphics while the interior remains visible, evening street
P07-DOME	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. fulldome planetarium audience reclining under an immersive projected ocean scene
P07-SIGNAGE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. subway station corridor with a row of tall vertical LED pillars showing abstract flowing graphics, commuters walking
P07-IMMERSIVE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. immersive exhibition room: visitors standing inside wall-to-floor projections of flowing ink
P07-LED-DIAGRAM	✔	Clean technical photograph: close-up of an LED display module with visible pixel pitch, a ruler beside, and the same module seen from a few meters away where pixels merge, split composition
P08-CRT	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. 1990s Korean family watching a CRT television in a living room, warm lamp, snacks on the table
P08-OTT	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. modern living room with a large wall TV showing a grid of colorful streaming-app tiles (abstract, no logos), remote in hand
P08-BINGE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. young woman watching a series on a tablet in bed at night, blue screen glow
P08-CREATOR	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. compact creator studio: camera on tripod, key light, acoustic panels, a desk with microphone and two monitors
P08-KPOP-SET	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. K-pop music video set: a colorful geometric stage, five dancers in formation under saturated lights, camera jib sweeping in foreground, haze

ID	Used	Prompt
P08-MUSICSHOW	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. behind the scenes of a TV music show: a jib camera operator and a steadicam operator moving in sync with dancers on a bright stage
P08-MV-NEON	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. performance music video still: a singer under magenta and cyan neon with smoke, anamorphic lens flare
P08-ADSET	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. commercial shoot for a beverage: product on a lit table set, large crew, video village with monitors and clients watching
P08-HOOK	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. extreme close-up of fingers snapping with slight motion blur, bright backlit background, high contrast
P08-FILMSET	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. Korean period film set: a rain rig showering a night alley, lanterns, actors in historical costume, camera on a dolly
P08-DRAMA	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. TV drama shoot in an apartment: two actors at a dining table, handheld camera operator close, boom above
P08-ANIM	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. animation studio floor: rows of desks with pen tablets, storyboards pinned on partitions
P08-LEDLOOP	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. downtown crossing at night with a giant LED screen on a building showing a looping abstract product animation, crowds
P08-SHORTFORM	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. three friends filming a short comedy sketch with a phone on a tripod in a kitchen, laughing
P09-FEED	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. close-up of a thumb scrolling a vertical short-video feed on a phone, blurred colorful frames
P09-LIVECOM	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. live commerce host presenting a skincare product to a phone on a ring light, products arranged, comment bubbles abstracted as light shapes
P09-ECOM	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. small online shop owner packing orders at a desk, laptop showing an order dashboard, shipping boxes
P09-AUTOMATION	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. two monitors with automated ad-campaign dashboards: abstract charts, audience segments and scheduling calendar, dark office
P09-GRID	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. planner arranging nine printed square photos into a 3x3 grid on a table to plan an Instagram feed
P09-DANCE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. teenagers filming a dance challenge with a phone on a tripod in a park, one checking the take
P09-TEXT	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. person typing a short text post on a phone at a cafe, coffee, minimal
P09-ANALYTICS	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. monitor showing a video analytics dashboard with an audience retention curve dropping after the first seconds (abstract, no text)
P09-AISTUDIO	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. creator directing AI video generation on a large screen: a grid of generated clip variations and a prompt panel, dark studio
P09-MCP	✔	Abstract clean illustration-style photograph: a laptop on a desk with glowing connector lines linking it to several floating translucent service panels (calendar, storage, chat, image), no text, dark background
P09-THUMB	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. designer comparing three thumbnail variations of the same video on a monitor, hand on mouse
P10-AGENCY	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. advertising agency meeting room: team presenting a campaign timeline on a screen to clients

ID	Used	Prompt
P10-PRODCO	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. video production company office: edit bays, a shelf with awards, a whiteboard with project pipeline
P10-FREELANCE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. freelance editor at home editing on a laptop, an invoice document open on a second screen
P10-MARKET	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. content market exhibition hall with booths and screens, delegates with lanyards
P11-PORTFOLIO	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. portfolio review: a mentor and a student watching a showreel on a monitor, notes on paper
P11-INTERVIEW	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. job interview: a candidate presenting a showreel on a laptop to two interviewers in a bright meeting room
P11-FIRSTDAY	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. new hire at an edit bay with a senior editor pointing at the timeline, first-day energy
P11-RESUME	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. a one-page resume, a business card and a phone showing a showreel on a desk, QR code area blurred
P11-REMOTE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. remote collaboration: video call on one monitor, shared editing timeline on another, headset
P11-SOLO	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. one-person video business desk: camera, laptop with invoices, gimbal, coffee, morning light
P11-MEETUP	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. industry networking event: young creators talking in small groups with name badges, projector in background
P12-INTERN	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. a silver-haired senior intern in a suit vest working beside young colleagues in a casual creative startup office, laughing
P12-AIASSIST	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. editor working with an AI assistant panel on screen that proposes storyboard frames while she adjusts them
P12-SMALLLED	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. small studio with a compact LED wall virtual background and a presenter, single camera
P12-MOCAP	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. actor in a motion capture suit with markers performing in a capture volume, cameras around
P12-SIM	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. monitor showing a fluid simulation render of water splashing, node graph beside
P12-STARTUP	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. two young founders pitching a video content startup to investors with a projected deck
P12-PORTSITE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. laptop and phone showing the same personal portfolio website with a video grid, on a clean desk
P12-PROCESS	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. wall covered with a hand-drawn production pipeline diagram and sticky notes, a person tracing the flow with a finger
P12-HIRING	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. a nearly empty row of interview chairs in a corporate lobby, one applicant waiting with a portfolio case
P13-INTERACTIVE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. interactive installation: a visitor's silhouette on a large wall triggering swirling particle light that follows her hand movements
P13-CRTTOWER	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. gallery installation of dozens of stacked vintage CRT televisions showing colorful abstract video, dark room, homage to video art pioneers

ID	Used	Prompt
P13-LEDROOM	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. infinity-mirror LED room with visitors reflected endlessly among points of light
P13-KINETIC	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. kinetic sculpture of hundreds of small mirrors tilting in waves, reflecting a spotlight across a gallery wall
P13-MUSEUM	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. contemporary art museum white hall with a huge video wall artwork and visitors seated on the floor
P13-SENSOR	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. artist wiring a depth sensor and microcontroller on a workbench, laptop with code (illegible)
P13-DATA	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. gallery projection of data visualization: flowing lines and dots mapped on a curved wall
P13-SOUND	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. sound installation: an array of small speakers hanging at ear height in a dark room, visitors walking between them
P13-OUTDOOR	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. outdoor media art festival at night: light installations along a riverside with crowds
P02-OPENER	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. cinematographer's eye pressed to a cinema camera viewfinder on a Seoul rooftop at golden hour, city skyline soft behind, focus on the eye and the eyepiece
P02-SIZE2-ELS	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. ELS shot: extreme long shot, the man is a tiny figure in a vast landscape of trees and a long path; the same young Korean man in a dark green coat standing on a quiet wooded campus path in autumn, overcast soft light, 35mm film look
P02-SIZE2-LS	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. LS shot: long shot, full body with plenty of environment around him; the same young Korean man in a dark green coat standing on a quiet wooded campus path in autumn, overcast soft light, 35mm film look
P02-SIZE2-FS	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. FS shot: full shot, head to toe filling most of the frame height; the same young Korean man in a dark green coat standing on a quiet wooded campus path in autumn, overcast soft light, 35mm film look
P02-SIZE2-KS	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. KS shot: knee shot, framed from the knees up; the same young Korean man in a dark green coat standing on a quiet wooded campus path in autumn, overcast soft light, 35mm film look
P02-SIZE2-MS	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. MS shot: medium shot, framed from the waist up; the same young Korean man in a dark green coat standing on a quiet wooded campus path in autumn, overcast soft light, 35mm film look
P02-SIZE2-BS	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. BS shot: bust shot, framed from the chest up; the same young Korean man in a dark green coat standing on a quiet wooded campus path in autumn, overcast soft light, 35mm film look
P02-SIZE2-CU	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. CU shot: close-up of the face filling the frame; the same young Korean man in a dark green coat standing on a quiet wooded campus path in autumn, overcast soft light, 35mm film look
P02-SIZE2-ECU	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. ECU shot: extreme close-up of the eyes only; the same young Korean man in a dark green coat standing on a quiet wooded campus path in autumn, overcast soft light, 35mm film look
P04-LOOK-REMBRANDT	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. studio portrait of a Korean woman in a plain grey top, Rembrandt lighting: key light 45 degrees high from the left creating a small triangle of light on the shadowed cheek, dark background, medium close-up, 85mm
P04-LOOK-BUTTERFLY	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. studio portrait of a Korean woman in a plain grey top, butterfly (paramount) lighting: key light high above the camera, symmetrical butterfly shadow under the nose, beauty look, reflector below, medium close-up, 85mm

ID	Used	Prompt
P04-LOOK-SPLIT	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. studio portrait of a Korean woman in a plain grey top, split lighting: key light exactly 90 degrees to the side, one half of the face lit and the other half in shadow, moody, medium close-up, 85mm
P04-LOOK-RIM	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. studio portrait of a Korean woman in a plain grey top, rim/back lighting: strong light from behind outlining hair and shoulders, face in soft fill, dark background, medium close-up, 85mm
P04-LOOK-LOOP	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. studio portrait of a Korean woman in a plain grey top, loop lighting: key at 30–40 degrees slightly above eye line, small loop shadow beside the nose, gentle fill, medium close-up, 85mm
P04-LOOK-SILHOUETTE	✔	Editorial documentary photograph, natural light, muted warm tones, realistic, no text, no logos, no watermark. People are Korean, contemporary. studio portrait of a Korean woman in a plain grey top, silhouette: subject completely dark against a bright window, no fill, medium close-up, 85mm

NOTE

Video is not about shooting.
It is about choosing what to show and what to hide.

From a single storyboard panel to an LED facade, from the first call time to the first showreel. This book is not a catalog of techniques but the order of decisions made on set. Practice comes first and theory follows, and every figure was redrawn to answer one question: why shoot it this way? Now that generative AI is part of the workflow, it is a book for practicing what does not change: the eye, the promise, the finish.

Jia Ahn
